BSC Proj. No. 2.8280.00

Executive Summary

BSC Group has prepared this Functional Design Report to document existing traffic operations, evaluate safety and operational deficiencies, and recommend improvements for a 3,500 foot segment of Massachusetts Avenue (Mass Ave), designated as Route 4 and 225 in Lexington, Massachusetts, between the intersections of Marrett Road and Pleasant Street / Follen Road. The study area intersections for the project include Mass Ave at Marrett Road, Mass Ave at Maple Street, and Mass Ave at Pleasant Street / Follen Road. The intersection of Mass Ave at Maple Street is included on the list of MassDOT 2010 HSIP Crash Clusters that covered crashes from 2007 to 2009.

Study Methodology

This report includes a review of existing traffic and roadway conditions, a review of existing deficiencies along the corridor and at each of the study intersections, safety analyses, and signal warrant analyses. This report evaluates several design alternatives along the corridor and at each of the study intersections and evaluates the capacity for each alternative under a 10-year planning horizon (2023).

Existing Deficiencies

Existing deficiencies that were identified along the corridor and at each of the study intersections are listed below.

Mass Ave Corridor – Fair to poor sidewalk conditions, large number of mid-block crosswalks, missing or outdated pedestrian accessible ramps, outdated emergency signal at fire station, and lack of bicycle accommodation

Mass Ave at Marrett Road - Inadequate traffic control, lack of pedestrian accommodation

Mass Ave at Maple Street - Lack of traffic control, short turning lanes on Maple Street westbound, narrow travel lanes on Mass Ave southbound, long vehicular delays during peak hours, lack of pedestrian / bicycle accommodation, poor service station driveway access

Mass Ave at Pleasant Street / Follen Road - Inadequate traffic control, poor pedestrian accommodations, limited on-street parking, outdated signal equipment for pedestrian crossing at Waldorf School, queues spill back onto Mass Ave from Waldorf School parents waiting in afternoon, conflicts between Pleasant Street northbound queues and Wilson Farm driveways

Safety Analysis

Over the recent three years reviewed (2009 to 2011), crash rates were calculated at each of the study intersections. At Mass Ave and Marrett Road, 14 crashes occurred over 3 years, resulting in a crash rate of 0.47, which is below both the statewide and District 4 average crash rates. At Mass Ave and Pleasant Street / Follen Road, 13 crashes occurred over 3 years, resulting in a crash rate of 0.50,

which is below both the statewide and District 4 average crash rates. At Mass Ave and Maple Street, 24 crashes occurred over 3 years, resulting in a crash rate of 0.63, which is above both the statewide and District 4 average crash rates. It is anticipated that the proposed improvements at Mass Ave / Maple Street will help to improve operations and safety at this location.

Signal Warrant Analysis

Traffic signal warrant analyses were conducted in order to justify the signalization of the three major unsignalized intersections in the corridor. Based on the results of these analyses, it was determined that all three major study intersections of Mass Ave / Maple Street, Mass Ave / Marrett Road, and Mass Ave / Pleasant Street / Follen Road met warrants 1 (Eight Hour Vehicular Volume), 2 (Four-Hour Vehicular Volume), 3 (Peak Hour), and 8 (Roadway Network).

Proposed Alternatives

This project proposes improvements along the length of Mass Ave in the project area, at the three major study intersections, for the pedestrian signal at the Waldorf School, and for the traffic control at the fire station at Locust Ave.

Along the corridor, general improvements include a proposed cross section with 6-foot sidewalks on both sides of the roadway, parallel parking or a grass strip, 5-foot wide bicycle lanes on both sides of the roadway, one 11-foot general use travel lane in each direction, and turning lanes at key intersections. The proposed cross-section narrows the travel lanes to provide the sense of a village center and to help reduce travel speeds. Additionally, the number of crosswalks across Mass Ave will be reduced to only be located at several strategic locations. These improvements align with MassDOT's Healthy Transportation Policy Directive by providing both sidewalks and bicycle lanes on both sides of Mass Ave, providing "safe and comfortable healthy transportation options" for the Mass Ave corridor.

The proposed improvements at the major study intersections generally include three alternatives: retain the existing design, signalize the intersection, or install a roundabout. For each location, the Massachusetts Roundabout Installation Screening Form was used to determine the appropriateness of installing a roundabout at the intersection. It was determined that a roundabout is not recommended at the intersections of Mass Ave at Marrett Road or Mass Ave at Maple Street. A roundabout is a candidate for the intersection of Mass Ave at Pleasant Street / Follen Road, warranting further review and analysis.

Three alternatives are proposed for the pedestrian signal at the Waldorf School. The first alternative is a flashing warning beacon that would consist of a flashing circular yellow signal for vehicles that would supplement the "Pedestrian (symbol)" warning sign. The second alternative would provide a pedestrian hybrid beacon, which flashes a yellow signal to motorists upon actuation by pedestrians, and then flashes a red signal to motorists indicating them to stop. The third alternative consists of installing a full pedestrian signal to replace in-kind the existing pedestrian signal, while providing upgraded signal timings with new traffic and pedestrian signal heads.

The existing emergency signal at the fire station at the corner of Mass Ave and Locust Ave consists of a flashing red light for the Locust Ave and fire station approaches and a flashing yellow light for the Mass Ave approach. Upon emergency pre-emption, the Mass Ave and Locust Ave approaches

turn solid red, allowing emergency vehicles to have the right of way. An existing crosswalk is located across the south leg of Mass Ave, between Locust Ave and the fire station, which is not equipped with a pedestrian signal. The existing signal heads are only 8” in diameter and do not conform to current Manual on Uniform Traffic Control Devices (MUTCD) standards.

Capacity Analyses

Capacity analyses were conducted for the three major study intersections under existing conditions, future No Build conditions under the 10-year planning horizon (2023), and for future Build conditions (2023) for the signalization and roundabout alternatives. These capacity analyses reviewed delay and LOS, as well as approach delays and queue lengths.

Recommendations

Based on the results of the roundabout screening tool, the capacity analyses, and the layout of the proposed alternatives, BSC recommends that traffic signals be installed at all three of the major study intersections. BSC recommends constructing all three signals at the same time, in order to fully implement coordination between the intersections.

BSC recommends that a rectangular rapid flashing warning beacon be installed at the pedestrian signal at the Waldorf School.

At the fire station, BSC recommends replacing the existing 8” signal heads with the current standard of 12”. An additional traffic signal head should be installed for the fire station egress.

List of Figures

Chapter 1: Existing Conditions

1.1 Project Background

BSC Group, Inc. (BSC) has prepared this Functional Design Report on behalf of the Town of Lexington, Massachusetts to document existing traffic operations, evaluate safety and operational deficiencies, and recommend improvements for the Massachusetts Avenue Intersections Project. This project includes a segment of Massachusetts Avenue (Mass Ave), designated as Route 4 and 225 in Lexington, Massachusetts, between the intersections of Marrett Road and Pleasant Street / Follen Road.

1.1.1. Study Area

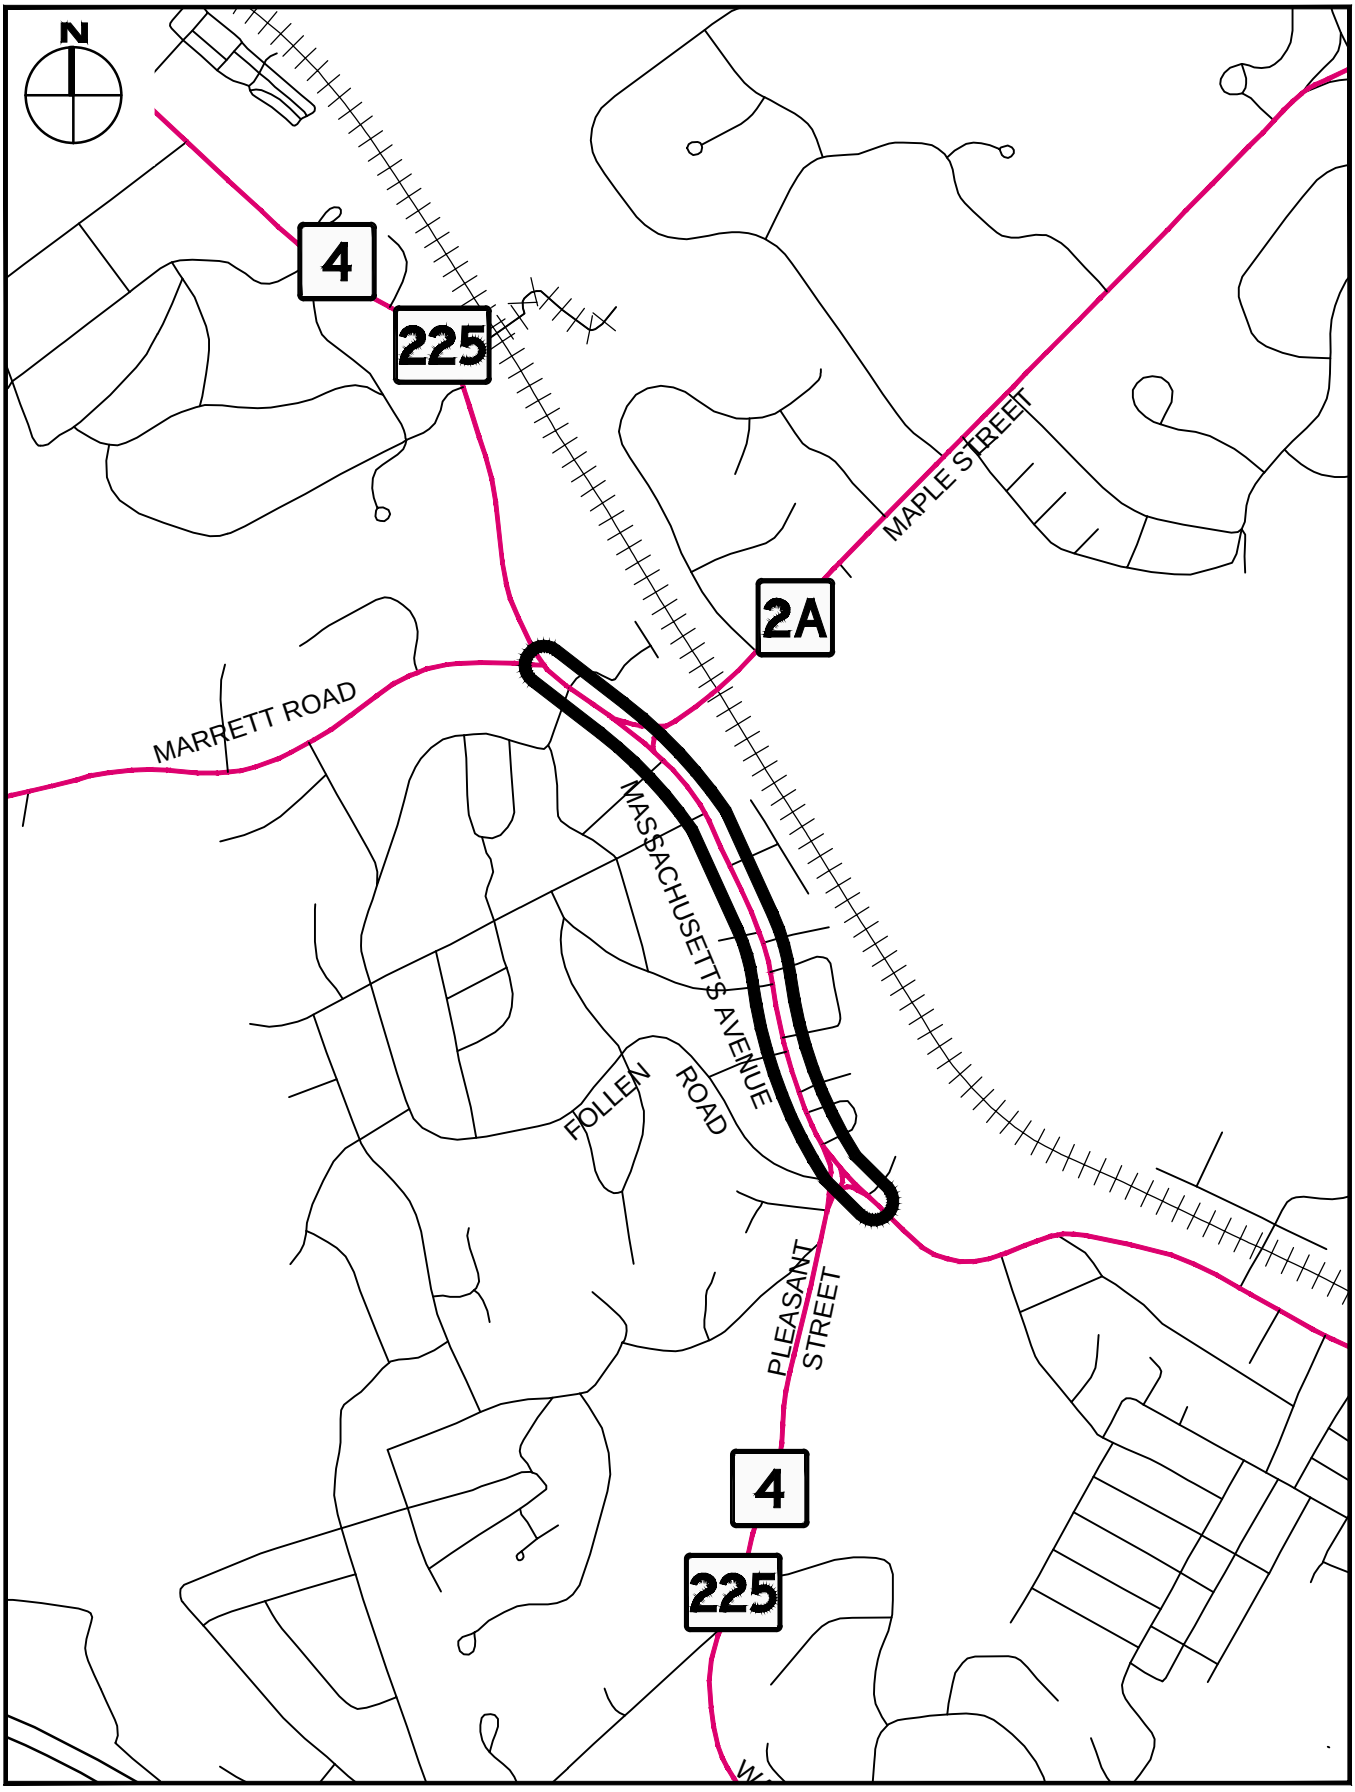
This segment of Mass Avenue is located in Lexington north of Route 2 and east of Route I-95 and is under the jurisdiction of the Town of Lexington. The segment is approximately 3,500 feet long and includes three major unsignalized intersections: Mass Ave at Marrett Road, Mass Ave at Maple Street, and Mass Ave at Pleasant Street / Follen Road.

Figure 1 displays the locus area for this project.

Massachusetts Avenue (Mass Ave) Corridor

Massachusetts Avenue (Mass Ave) is classified as an urban principal arterial that is under the jurisdiction of the Town of Lexington. Mass Ave is designated as the Battle Road Scenic Byway and has many historic elements along the route. In the project area, Mass Ave generally runs in a northwest-southeast direction, with the limits of the study beginning at Marrett Road in the northwest and continuing southeast to Pleasant Street. Mass Ave generally provides one 22-foot wide multi-purpose lane in each direction along its length for this project, with no delineated shoulders. Sidewalks are provided along both sides of Mass Ave.

The project area includes three major intersections at Marrett Road, Maple Street, and Pleasant Street. There are also 11 side-streets that intersect with Mass Ave, along with many driveways. A fire station is located at the intersection of Mass Ave and Locust Ave. Access to and egress from the fire station is controlled by emergency traffic signals on Mass Ave.



Project Location Map
East Massachusetts Avenue Intersections Project
Lexington, Massachusetts

Figure 1
Scale: 1" = 1000'

BSC GROUP

The posted speed limit in both the northbound and southbound direction on Mass Ave is 35 MPH between Marrett Road and Independence Avenue and 30 MPH between Independence Avenue and Pleasant Street. These are consistent with the designated speed limits according to Massachusetts Speed Regulation 158[1]. There is a school zone in the vicinity of the Waldorf School which posts a school speed limit of 20 MPH during the times when school is in session.

On-street parking is permitted on Mass Ave from Maple Street to Pleasant Street. The highest use of on-street parking along Mass Ave is between Independence Avenue and Pleasant Street. This parking demand could be attributed to businesses, churches, and the Waldorf School.

The project area is served by two MBTA bus routes: Route 62 (Bedford V.A. Hospital to/from Alewife Station) and Route 76 (Hanscom/Lincoln Labs to/from Alewife Station). Within the project limits, there are six (6) bus stops in the northbound direction and five (5) bus stops in the southbound direction. The Town of Lexington's Lexpress bus system also serves the area of the project, with Route 1 traveling southbound on Mass Ave and turning right onto Pleasant Street, then looping around back to Mass Ave northbound. Route 3 of the Lexpress travels westbound on Maple Street and turns right onto Mass Ave northbound.

Land uses along Mass Ave include residential, commercial, and institutional. The Minuteman Commuter Bikeway runs parallel to Mass Ave on its east side, from Arlington in the south and continuing through Bedford in the north.

Massachusetts Avenue (Mass Ave) at Marrett Road

Marrett Road generally runs in an east-west direction from Massachusetts Avenue in the east to the Lincoln Town Line in the west. Marrett Road is designated as Route 2A and is classified as an urban minor arterial under the jurisdiction of the State.

Marrett Road intersects Mass Ave to form an unsignalized intersection with Marrett Road under yield control. Marrett Road provides one general use 13-foot wide travel lane with a 4-foot shoulder. Mass Ave northbound provides one 11-foot wide through lane and one 10-foot wide left-turn lane with a 1-foot shoulder. Mass Ave southbound provides one 20-foot wide general use travel lane. Sidewalks are provided on both sides of all approaches. Land use in the vicinity of the intersection is residential and a museum. The posted speed limit on Marrett Road in the vicinity of the intersection is 35 MPH.

[1] Special Speed Regulation No. 158, The Commonwealth of Massachusetts Department of Public Works, Town of Lexington, dated April 22, 1958, with amended Regulation No. 158-C

Massachusetts Avenue (Mass Ave) at Maple Street

The segment of Maple Street near its intersection with Mass Ave is under the jurisdiction of the Town of Lexington, while further away from the intersection, it is under the jurisdiction of the State. Maple Street generally runs in an east-west direction from Mass Ave in the east to Lowell Street in the west. Maple Street is designated as Route 2A and is classified as an urban minor arterial roadway.

Maple Street intersects Mass Ave to form an unsignalized intersection; the Maple Street approach acts as if under stop control, though no stop line or stop sign are provided. Mass Ave northbound provides one general use 20-foot wide lane, while Mass Ave southbound provides one 11-foot wide left-turn lane and one 9-foot wide through lane with a one-foot shoulder. At its intersection with Mass Ave, Maple Street widens to provide a 16-foot wide left-turn lane and a painted channelized 14-foot wide right-turn lane with a 2-foot shoulder. The posted speed limit on Maple Street in the vicinity of the intersection is 25 MPH. It should be noted that this intersection is included on the list of MassDOT 2010 HSIP Crash Clusters that covered crashes from 2007 to 2009.

Massachusetts Avenue (Mass Ave) at Pleasant Street / Follen Road

This location is a complex intersection with several approaches, a large paved area, and a round, landscaped island offset to the west of Mass Ave measuring approximately 50 feet in diameter. The intersection acts as two separate intersections, with Pleasant Street intersecting Mass Ave and Follen Road intersecting Pleasant Street.

Pleasant Street generally runs in a north-south direction from Mass Ave in the north to Concord Avenue in the south. Pleasant Street provides access to the regional highway network at its interchange with Route 2. Pleasant Street is designated as Routes 4 and 225 and is classified as an urban principal arterial under the jurisdiction of the Town of Lexington.

Pleasant Street intersects Mass Ave to form a T intersection with Pleasant Street under stop control. Mass Ave northbound provides one 22-foot wide general use multi-purpose lane, while Mass Ave southbound provides one 23-foot wide general use multi-purpose lane. Pleasant Street provides one

14-foot wide left-turn lane and one 12-foot wide right turn lane. The posted speed limit on Pleasant Street in the vicinity of the intersection is 30 MPH.

Follen Road is classified as an urban collector roadway and is under the jurisdiction of the Town of Lexington. Follen Road generally runs in a northwest-southeast direction from Pleasant Street in the southeast to Marrett Road in the northwest. Follen Road intersects Pleasant Street just south of where Pleasant Street intersects Mass Ave. Follen Road is under stop control and provides one 15-foot wide general use travel lane in each direction.

1.1.2. Existing Conditions

This segment of Mass Ave is characterized by heavy vehicular, bicycle and pedestrian use. During peak hours, the three major unsignalized intersections experience long vehicle delays and queues. There are pedestrian safety concerns along the corridor, resulting from high vehicular volumes and numerous pedestrian crossings. The Mass Ave corridor and three major intersections are characterized by many crashes, the majority of which are rear-end and angle crashes, as is outlined further in Chapter 3.

The following section lists deficiencies that are present along the Mass Ave corridor and at the three major unsignalized intersections.

Massachusetts Avenue (Mass Ave) Corridor

- Fair to poor Sidewalk Conditions – Along the entire corridor of Mass Ave, many of the sidewalks are in poor condition: either warped, cracked, or broken. This is due in part to age, but also in part to the tree and shrub roots that push underneath the surface. The poor sidewalk conditions can cause safety hazards to pedestrians, and can inhibit the travel path for disabled persons.
- Large Number of Crosswalks – There are 7 existing crosswalks along the entire length of the Mass Ave corridor between Marrett Road and Pleasant Street. Despite the large number, crosswalks are missing at several key locations. Additionally, a large number of the existing crosswalks are at mid-block locations, each of which presents a vehicle-pedestrian conflict point.
- Pedestrian Accessible Ramps – Despite the large number of painted crosswalks, most of them are not accessible, with wheelchair ramps that do not meet current ADA/AAB standards, or with no wheelchair ramps at all.
- Outdated Emergency Signal – The existing emergency traffic signals located at the Fire Station near Locust Avenue are post-mounted and outdated. The signal lenses are 8" while the current standard of 12" would improve visibility for drivers. During the Road Safety Audit conducted for the intersection of Mass Ave / Maple Street[2], it was noted that "vehicles frequently run the red signal, especially during times when the signal is active but a fire vehicle is not leaving the station with lights flashing, such as when the vehicle backs in upon its return to the station."
- Lack of Bicycle Accommodation – Generally, the Mass Ave corridor consists of one 22-foot wide multi-purpose lane in each direction, with no lanes marked specifically for bicycles. The Minuteman Bike Path is located parallel to the east of Mass Ave, and many bicyclists prefer to use Mass Ave as it has more connections to the neighborhood. Some bicyclists also use Mass Ave to connect to the Bike Path via Maple Street. There are two other informal connections between

[2] Road Safety Audit, Massachusetts Avenue at Maple Street, May 17, 2012, prepared by BETA Group, Inc.

Mass Ave and the Bike Path within the project limits: one at Curve Street and one at the Waldorf School. Additionally, it has been reported during public hearings that many commuter bicyclists prefer to use Mass Ave over the Bike Path.

Massachusetts Avenue (Mass Ave) at Marrett Road

- Inadequate Traffic Control – The Marrett Road approach is under yield control, and the yield sign is located approximately 60 feet back from where Marrett Road intersects Maple Street. In addition, vehicles traveling eastbound on Marrett Road approach Mass Ave at relatively high speeds and at an angle, with a large right-turning radius. Because of these elements, vehicles turning right onto Mass Ave barely yield to vehicles already traveling southbound on Mass Ave.
- Lack of Pedestrian Accommodation – While sidewalks are provided on both sides of Marrett Road and Mass Ave, there are no wheelchair ramps or crosswalks at the intersection. In addition, the condition of the existing sidewalks is fair to poor, with many being cracked or broken due to age, or tree and shrub roots.

Massachusetts Avenue (Mass Ave) at Maple Street

A Road Safety Audit[3] (RSA) was conducted in 2012 for the intersection of Mass Ave and Maple Street. Members of MassDOT, the Town of Lexington, CTPS, and Beta Group, Inc. reviewed the existing conditions at the intersection and a report was prepared to discuss the existing deficiencies and potential improvements to be made at the intersection. The following existing deficiencies include those noted in the RSA.

- Lack of Traffic Control – The intersection at Mass Ave / Maple Street is currently marked to provide one approach lane on Maple Street that divides into one channelized right-turn lane with a large radius and one left-turn lane. The eastbound and westbound directions are separated by a traffic circle. There are no stop signs or stop lines for left-turning vehicles from Maple Street. The right-turning vehicles from Maple Street have no indication whether they should stop or yield, and the angle of the roadway makes it difficult for drivers to look left to avoid other vehicles traveling northbound on Mass Ave. The RSA recommended installing a stop sign for the left-turn lane and a yield sign for the right-turn lane. These signs have since been installed at the intersection.
- Short Turning Lanes on Maple Street Westbound – As indicated above, one approach lane on Maple Street westbound divides into one left-turning and one right-turning lane. The right-turning lane provides approximately 80 feet of storage, while the left-turning lane provides just 30 feet of storage, not long enough for more than one vehicle.
- Narrow Travel Lanes on Mass Ave Southbound – The Mass Ave southbound approach provides one 11-foot wide left-turn lane and one through lane that measures just 9 feet wide, with a one-foot shoulder.
- Long Delays – The Maple Street westbound approach is currently characterized by long delays, especially during the weekday morning peak hour, when drivers are traveling northbound on Mass Ave towards Route 2 or I-95. The large number of crashes at this location, which is discussed later in Chapter 3, may be caused by driver frustration at this location.

[3] *Road Safety Audit, Massachusetts Avenue at Maple Street, Town of Lexington*, dated May 17, 2012, prepared by Beta Group, Inc.

- Lack of Pedestrian / Bicycle Accommodation – Sidewalks are provided on both sides of Mass Ave and on the south side of Maple Street, however there are no existing crosswalks or wheelchair ramps at the intersection. There is an existing mid-block crosswalk just south of the intersection near Plainfield Street. However, there are no wheelchair ramps for this crosswalk. Maple Street acts as a connection for pedestrians and bicyclists to the Minuteman Bicycle Path, which intersects Maple Street approximately 300 feet from Mass Ave on its east side. However, the lack of bicycle and pedestrian facilities at the intersection affects their accessibility.

- Service Station Driveway Access – The existing service station on the northeast corner of the intersection has three curb cuts along the north side of Maple Street, the widest of which is approximately 70 feet. This means that vehicles entering or exiting the service station have multiple points of conflict with vehicles traveling on Maple Street.

Massachusetts Avenue (Mass Ave) at Pleasant Street / Follen Road

- Inadequate Traffic Control / Driver Confusion – This intersection is characterized by a wide area of open pavement, with an approximate 50-foot diameter traffic circle offset to the west of Mass Ave, creating a roundabout-like intersection. The geometry of the intersection implies that it should operate as a roundabout, however actually both Pleasant Street and Follen Road are under stop control. Drivers, especially those that are new to the area, are confused by the current operations. For example, drivers traveling eastbound on Pleasant Street and wish to turn onto Follen Road sometimes take a direct left, when correct operation would be to drive to the stop line on Mass Ave, turn left onto Mass Ave, then turn left again around the circle onto Follen Road.

- Poor Pedestrian Accommodations – The existing crosswalks at this intersection are long, in some cases over 75 feet in length. There are no existing wheelchair ramps for the crosswalks. In addition, there is no sidewalk on the south side of Pleasant Street, which is a common route for pedestrians going to or from the nearby Wilson Farms.

- Limited On-Street Parking – This area is frequented by patrons of three churches, the Waldorf School, and Wilson Farms. On-street parking is available but unmarked along Mass Ave. Parking is in high demand in the area, particularly on Sundays and during special events such as funeral services.

- Waldorf School – There is a signalized pedestrian crosswalk at the Waldorf School driveway; the signal equipment is outdated and provides a long crossing time for pedestrians. A crossing guard is present during the weekday morning and afternoon school periods to assist students and parents crossing Mass Ave. When school lets out in the afternoon, parents queue entering into the school driveway and spill back onto Mass Ave, waiting to pick up their children. This occurs for approximately 30 minutes each afternoon.

- Wilson Farm – Wilson Farm is located on Pleasant Street just south of its intersection with Mass Ave and provides three driveway access points off of Pleasant Street. While the north-most driveway is not part of the intersection and is out of the scope of this project, it is of note that many crashes were recorded at this location, and there are often conflicts between vehicles queuing on Pleasant Street northbound and vehicles using the Wilson Farm driveways. In addition, employees and patrons of Wilson Farm often park on Mass Ave east of Pleasant Street.

Chapter 2: Traffic Volumes

2.1 Automatic Traffic Recorder (ATR) Counts

Existing daily traffic volumes were conducted on September 14 and 15, 2011 over a 48-hour period on Mass Ave (north of Curve Street), Maple Street (east of Mass Ave), and Pleasant Street (south of Mass Ave), through the placement of Automatic Traffic Recorders (ATR).

A summary of the 2011 daily average and peak hour traffic volumes are shown in Table 1.

Table 1: Traffic Volume Summary

		Morning Peak Hour			Afternoon Peak Hour		
Location	Weekday 24-hour Volume[a]	Traffic Volumes[b]	K-Factor[c]	Dir. Dist.[d]	Traffic Volumes[b]	K-Factor[c]	Dir. Dist.[d]
Massachusetts Avenue (north of Curve Street)	20,161	1,530	0.076	57% SB	1,604	0.079	51% NB
Maple Street (east of Massachusetts Avenue)	12,630	876	0.069	65% WB	1,211	0.094	68% WB
Pleasant Street (south of Massachusetts Avenue)	13,815	1,191	0.086	73% SB	967	0.069	52% SB

[a] *Measured in vehicles per day*
[b] *Measured in vehicles per hour*
[c] *Percentage of daily traffic during the peak hour*
[d] *Directional Distribution*

Supplemental daily traffic volumes were obtained from the report entitled Massachusetts Avenue Traffic Evaluation[4]. These volumes were conducted in March 2009 on Mass Ave (both north and south of Marrett Road), Mass Ave (south of Pleasant Street), and Marrett Road (west of Mass Ave).

Table 2: Supplemental Traffic Volumes

Location	NB/EB	SB/WB	Weekday 24-hour volume
Massachusetts Avenue (north of Marrett Road)	6,629	7,203	13,832
Massachusetts Avenue (south of Marrett Road)	8,772	9,646	18,418
Massachusetts Avenue (south of Pleasant Street)	6,412	6,055	12,467
Marrett Road (west of Mass Ave)	3,946	3,714	7,660

[4] Prepared by Weston & Sampson Engineers, Inc., June 2009

Speed Regulations & Vehicle Speeds

As part of the data collection program, vehicles speeds were collected over a 48-hour period at the ATR locations. Table 3 below compares the posted speed limits with the 85th percentile speeds. The posted speed limits are consistent with the designated speed limits according to Massachusetts Speed Regulation 158 (see Appendix).

Table 3: Traffic Speed Summary

Location	Posted Speed Limit (MPH)	85th Percentile Speed
Massachusetts Avenue northbound (north of Curve Street)	35	36
Massachusetts Avenue southbound (north of Curve Street)	35	36
Maple Street westbound (east of Massachusetts Avenue)	25	33
Pleasant Street northbound (south of Massachusetts Avenue)	30	27

2.2 Turning Movement Counts (TMC)

In addition to the daily traffic volume counts, turning movement counts (TMCs) were conducted on September 15, 2011 at the three major unsignalized intersections:

- Massachusetts Avenue at Marrett Road
- Massachusetts Avenue at Maple Street
- Massachusetts Avenue at Pleasant Street / Follen Road

These TMCs were conducted during the weekday morning (7:00 – 9:00AM) and afternoon (12:00 – 6:00PM) peak hours. The results of these counts indicate that the peak hours of traffic at all three intersections were 7:45 AM – 8:45 AM and 4:45 – 5:45 PM on weekdays. Existing 2011 traffic volumes were increased by a rate of one-half percent per year over two years to develop 2013 Baseline traffic volumes.

Existing peak hour turning movement traffic counts are displayed in Figure 2. Complete traffic volume count data are contained in the Appendix.

2.3 Pedestrian and Bicycle Counts

The number of pedestrians was recorded at the three major intersections as well as at the six mid-block crossings along Mass Ave. The number of bicyclists was recorded at the three major intersections. Each of these counts was conducted during weekday morning and afternoon peak hours.

Existing 2011 peak hour pedestrian and bicycle counts are displayed in Figures 3 and 4, respectively. Complete traffic volume count data are contained in the Appendix.

2.4 Development Projects and Growth Rate Adjustments

Future Condition traffic volume projections generally consist of background growth, and traffic generated from specific proposed development projects in the study area. This report examined traffic conditions ten years into the future (2023) with the proposed geometric improvements.

Based on discussions with the Central Transportation Planning Staff (CTPS), a compounded one-half percent annual growth rate for traffic will be employed to account for all background growth that will occur over the ten year planning horizon. Discussions with the Town of Lexington Planning Board revealed that there are no approved or proposed projects near the study area of this report.

2.5 Seasonal Factors

The Massachusetts Department of Transportation (MassDOT) no longer provides seasonal factors, but issues a *Monthly ADT Comparisons Report*, which provides data from permanent count stations across the state. Seasonal adjustment factors should be based off of data from the *Monthly ADT* report and applied to existing traffic count data in order to reflect average traffic volume conditions.

The nearest count station (4798 – Route 2 West of Pleasant Street, Lexington) indicates that traffic counts in September are 0.1 percent greater than the average month. However, in order to provide a conservative estimate of traffic conditions, no seasonal adjustment factors were applied to the traffic counts.

2.6 Future Year Conditions

In order to evaluate traffic impacts associated with the proposed improvements for the Mass Ave Intersections Project, future No-Build Condition traffic volumes were estimated to provide a baseline condition for comparison. The future No Build condition assumes that no improvements are constructed for the project. The No-Build Condition traffic volumes (Figure 5) were projected for the year 2023 based on baseline traffic volume data and one-half percent per year compounded over ten years as the general background growth.

Chapter 3: Safety Analysis

Crash data for the study area intersections were obtained from MassDOT for the most recent 3 years on record (2009 to 2011). Crash rates were calculated for all of the study area intersections. The rates represent the number of crashes per million vehicles entering the intersection. The most recent statewide and district average crash rates issued by MassDOT (2013) indicate that the statewide average for unsignalized intersections is 0.60, while the District 4 (which includes the Town of Lexington) average for unsignalized intersections is 0.58. These rates represent 'average' crash experience and serve as a basis for comparing reported crash rates for study area intersections. The results of this analysis, including the classifications of the reported crashes, are listed in Table 4.

As can be seen in Table 4, the calculated crash rates at Mass Ave / Marrett Road and Mass Ave / Pleasant Street / Follen Road were calculated to be 0.47 and 0.50, respectively, both of which are below the average State and District crash rates.

The crash rate at the intersection of Mass Ave / Maple Street, where there were 24 crashes over a three year period, was calculated to be 0.63 which is above both the average State and District crash rate. As part of this report, BSC will investigate several alternatives to address the high number of crashes and improve safety, not only at this location but also at the other two study area intersections.

Also as part of this study, segmental crash rates were calculated along the length of Mass Ave between the intersections of Mass Ave / Marrett Road and Mass Ave / Pleasant Street / Follen Road. Mass Ave is classified as an Urban Principal Arterial, for which the average crash rate is given as 1.99. During the three years studied (2009 to 2011), there were 24 crashes along the segment that is 0.6 miles long. This resulted in a crash rate of 1.78 which is below the MassDOT average crash rate.

In total, approximately 88% of the crashes at the three study area intersections were either rear-end (19 / 37%) or angle (26 / 51%) crashes. Both of these crash types are likely due to the long queues, inadequate gaps in mainline traffic, and driver impatience at the study area intersections.

It should be noted that during the three years studied, there was one crash involving a pedestrian, which occurred at the intersection of Mass Ave and Pleasant Street / Follen Road. Also during this time, there were two bicycle crashes, one located at the intersection of Mass Ave / Maple Street and one at Mass Ave / Marrett Road. It is also of significance that one fatality occurred in October 2008 at the intersection of Massachusetts Avenue and Barnes Place.

Crash data and crash rate worksheets are contained in the Appendix.

Chapter 4: MUTCD Signal Warrants

A traffic signal warrant analysis was conducted in order to justify the signalization of the three major unsignalized intersections. Utilizing traffic volumes from the collected traffic data, a Traffic Signal Warrant analysis was conducted for these intersections as part of the safety and operational analysis.

The current *Manual on Uniform Traffic Control Devices (MUTCD)* contains nine traffic signal warrants, at least one of which must be satisfied, in order to justify the installation or continuous operation of traffic signals at a particular location. Satisfying one or more warrants, however does not necessarily justify the installation or continuous operation of a traffic signal. The traffic signal warrants are:

- Warrant 1: Eight-Hour Vehicular Volume;
- Warrant 2: Four-Hour Vehicular Volume
- Warrant 3: Peak Hour
- Warrant 4: Pedestrian Volume
- Warrant 5: School Crossing
- Warrant 6: Coordinated Signal System
- Warrant 7: Crash Experience
- Warrant 8: Roadway Network
- Warrant 9: Intersection Near a Grade Crossing

Signal warrant analyses were conducted using the procedure contained in the MUTCD. Not all warrants were evaluated for each intersection, depending on the applicability and data available for the location. Table 5 below displays which of those warrants that were evaluated were met for the three study area intersections.

Table 5: Warrant Analysis

Warrant / Location	Mass Ave / Maple Street	Mass Ave / Marrett Road	Mass Ave / Pleasant Street / Follen Road
Warrant 1	**YES**	**YES**	**YES**
Warrant 2	**YES**	**YES**	**YES**
Warrant 3	**YES**	**YES**	**YES**
Warrant 8	**YES**	**YES**	**YES**

See the Appendix for signal warrant analyses worksheets.

Chapter 5: Operational Analysis

5.1 Existing / Future Year Capacity Analysis

Intersection capacity analyses have been performed to determine traffic operations under existing and future No Build volume conditions. For the purposes of this report, the intersections of Pleasant Street/Follen Road and Mass Ave/Pleasant Street were analyzed as two separate intersections. Table 6 summarizes the results of the analyses.

Capacity analyses provide a standardized indication of the ability of an intersection to accommodate the traffic demands placed upon it. The primary results of capacity analyses are intersection delay, (by approach and overall delay) and level of service. Level of service (LOS) is a qualitative measure that describes operating conditions through letter designations, from A to F. Level of service A represents the best operating conditions, while level of service F represents the worst. Level of Service D is generally considered to be acceptable.

Due to the known issues with the HCM 2010 methodology in the Synchro traffic analysis software, the results of the capacity analyses were conducted using the HCM 2000 methodology.

Table 6: LOS Summary – Existing and Future Conditions

Table 6 shows the overall delay and LOS under Existing and No Build conditions during the weekday morning and afternoon peak hours.

Under existing conditions, the Marrett Road eastbound approach operates at LOS F during both the weekday morning and afternoon peak hours. The Mass Ave northbound left-turn movement operates at LOS D during the weekday morning peak hour and LOS B during the weekday afternoon peak hour. The Maple Street westbound left-turn movement operates at LOS F during both peak hours, while the Maple Street westbound right-turn movement operates at LOS F and E during the weekday morning and afternoon peak hours, respectively. During both peak hours, the Pleasant Street eastbound left-turn operates at LOS F and the Pleasant Street eastbound right-turn operates at LOS C. The Follen Road approach operates at LOS D during the weekday morning peak hour and at LOS C during the weekday afternoon peak hour.

Under the future No Build condition, the Marrett Road eastbound approach operates at LOS F during both the weekday morning and afternoon peak hours. The Mass Ave northbound left-turn movement operates at LOS D during the weekday morning peak hour and LOS B during the weekday afternoon peak hour. The Maple Street westbound left- and right-turn movements operate at LOS F during both peak hours. During both peak hours, the Pleasant Street eastbound left-turn operates at LOS F and the Pleasant Street eastbound right-turn operates at LOS C. The Follen Road approach operates at LOS D during the weekday morning peak hour and at LOS C during the weekday afternoon peak hour.

All capacity analysis worksheets can be found in the Appendix.

Chapter 6: Proposed Geometry

As discussed in Section 1.1.2, there are a variety of existing issues along the corridor and at the major project intersections that need to be addressed. These existing issues, including traffic control, pedestrian and bicycle accommodations, and vehicular delays, are listed below.

Massachusetts Avenue (Mass Ave) Corridor

- Poor Sidewalk Conditions
- Large Number of Crosswalks
- Pedestrian Accessible Ramps
- Outdated Emergency Signal
- Lack of Bicycle Accommodation

Massachusetts Avenue (Mass Ave) at Marrett Road

- Inadequate Traffic Control
- Lack of Pedestrian Accommodation

Massachusetts Avenue (Mass Ave) at Maple Street

- Lack of Traffic Control
- Short Turning Lanes on Maple Street Westbound
- Narrow Travel Lanes on Mass Ave Southbound
- Long Delays
- Lack of Pedestrian / Bicycle Accommodation
- Service Station Driveway Access

Massachusetts Avenue (Mass Ave) at Pleasant Street / Follen Road

- Inadequate Traffic Control
- Poor Pedestrian Accommodations
- Limited On-Street Parking
- Waldorf School

Roadway geometry and traffic control changes are being proposed along the Mass Ave corridor and at each of the three study area intersections in order to improve operations and safety for vehicles, pedestrians, and bicycles. The sections below discuss the proposed changes along the Mass Ave corridor, and review several proposed alternatives at each of the three study area intersections.

6.1 Mass Ave Corridor

Generally, the proposed improvements to the Mass Ave corridor consist of 6-foot sidewalks on either side of the roadway, parallel parking or a grass strip, 5-foot wide bicycle lanes on each side of the

roadway, and one 11-foot general use travel lane in each direction. The proposed sidewalks would provide a smooth and level walking surface, improving upon the existing sidewalks that are generally sloped or cracked due to tree or shrub roots. Areas with proposed grass strips would provide areas for landscaping or planting. The vehicular travel way would be narrowed, providing a sense like a downtown boulevard which may reduce travel speeds. Bicycle lanes would connect bicycle access through this section of Lexington. In addition, the number of crosswalks along the corridor would be reduced to only be located at strategic locations.

6.1.1 MassDOT Healthy Transportation Policy Directive

The MassDOT Healthy Transportation Policy Directive[5] was issued to ensure that all MassDOT facilities "have access to safe and comfortable transportation options" including walking, bicycling and taking transit. The Directive indicates that MassDOT funded and/or design projects shall "seek to increase and encourage more pedestrian, bicycle and transit trips."

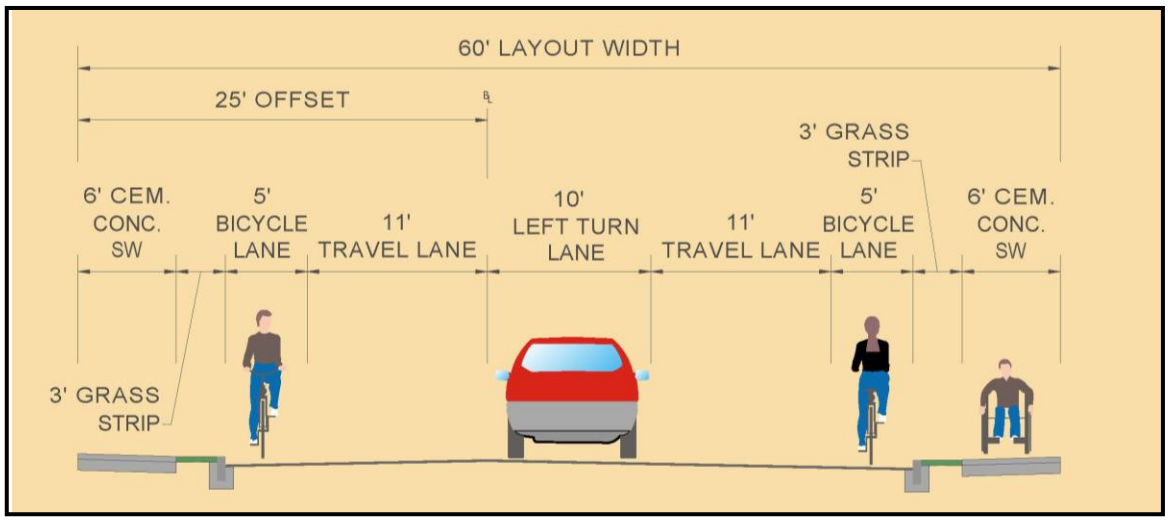
The proposed Mass Ave project is rebuilding the existing sidewalks along the corridor, providing 6-foot wide ADA/AAB compliant sidewalks along both sides of the roadway between Pleasant Street and Marrett Road. For each proposed alternative, the Project proposes sidewalks on both sides of Marrett Road, on the south side of Maple Street, and on both sides of Follen Road and Pleasant Street. The proposed sidewalks on Pleasant Street will provide formal connections between Mass Ave and Wilson Farm.

In addition to providing ADA/AAB compliant sidewalks, the proposed 5-foot bicycle lanes on both sides of Mass Ave will further serve to promote healthy transportation options. The corridor does not currently provide exclusive bicycle accommodation and it is expected that the proposed bicycle lanes will promote bicycle usage. The bicycle lanes will provide a connection via Maple Street to the existing Minuteman Commuter Bikeway, which runs parallel to Mass Ave and is a part of the Bay State Greenway system.

6.1.2 Marrett Road to Maple Street

Between Marrett Road and Maple Street, the proposed roadway cross-section consists of one 11-foot travel lane in each direction, 5-foot bicycle lanes in each direction, and a 6-foot sidewalk buffered by a 3-foot wide grass strip on each side. In addition, a 10-foot wide turning lane in the center of the roadway provides approximately 130 feet of storage for its approach to Marrett Road, then transitions to provide approximately 130 feet of storage for its approach to Maple Street. On-street parking is prohibited in this section.

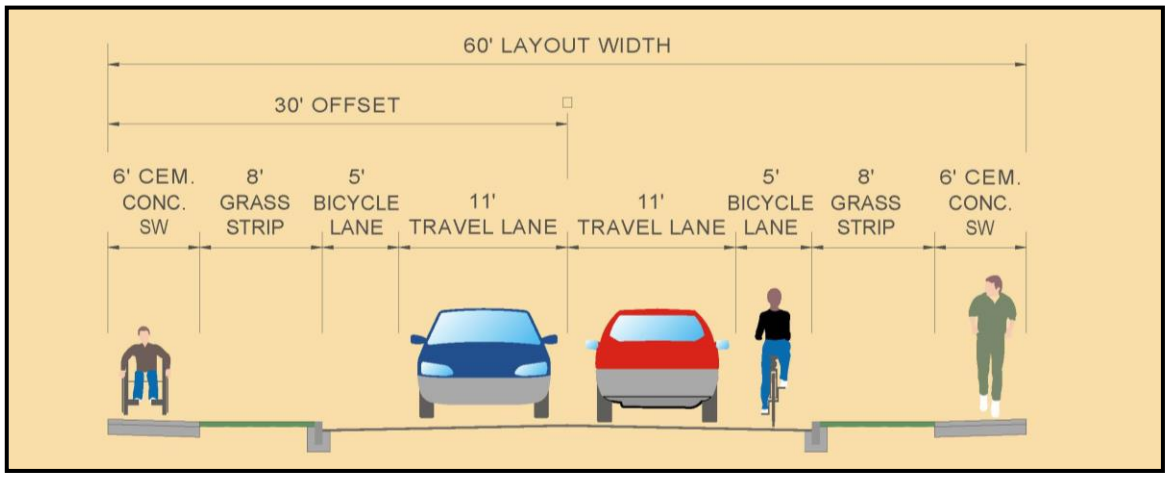
[5] Healthy Transportation Policy Directive, Policy P-13-0001, MassDOT, September 9, 2013



Proposed Cross-Section of Mass Ave between Marrett Road and Maple Street

6.1.3 Maple Street to Curve Street

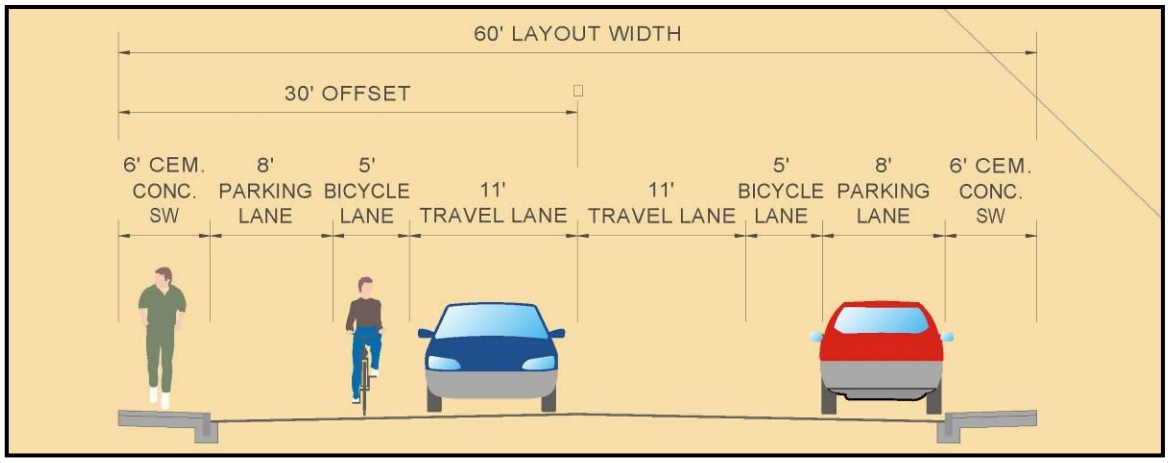
Along Mass Ave between Maple Street and Curve Street, the proposed roadway cross-section consists of one 11-foot general use travel lane in each direction, a 5-foot bicycle lane on both sides, and an 8-foot grass strip buffering a 6-foot cement concrete sidewalk on both sides of the roadway. A few on-street parking spaces are proposed on the west side of Mass Ave for the use of the local businesses in this area. A crosswalk is proposed across Mass Ave at Locust Avenue.



Proposed Cross-Section of Mass Ave between Maple Street and Curve Street

6.1.4 Curve Street to Pleasant Street

Between Curve Street and Pleasant Street along Mass Ave, the proposed roadway cross-section consists of one 11-foot travel lane in each direction, 5-foot bicycle lanes in each direction, 8-foot wide parking lanes on both sides of the roadway, and a 6-foot sidewalk on each side. Crosswalks across Mass Ave are proposed on the north side of the southern leg of Curve Street and south of Barnes Place near the Waldorf School.



Proposed Cross-Section of Mass Ave between Curve Street and Pleasant Street

6.1.5 Pedestrian Accessibility

The pedestrian improvements proposed as part of this Project include rebuilding existing sidewalks and reviewing and consolidating the locations of crosswalks across Mass Ave. The existing sidewalks are generally cracked or sloped due to tree and shrub roots. The Project proposes to rebuild the sidewalks to provide a smooth and level walking surface, with a consistent 6-foot width. The project also proposes to reconstruct or build new accessible pedestrian ramps where necessary.

Currently, there are seven existing crosswalks along Mass Ave corridor between Marrett Road and Pleasant Street. Despite the large number, crosswalks are missing at several key locations. Additionally, a large number of the existing crosswalks are at mid-block locations, each of which presents a vehicle-pedestrian conflict point. The Project proposes to eliminate or move some of these crosswalks, resulting in two crosswalks across Mass Ave at each of the study area intersections: Marrett Road, Maple Street, and Pleasant Street. Additional mid-block crosswalks will be located just south of Locust Ave, north of Curve Street, and north of Pleasant Street at the Waldorf School and Follen Church.

6.2 Massachusetts Roundabout Installation Screening Form

The Massachusetts Roundabout Installation Screening Tool, developed by the Central Transportation Planning Staff (CTPS), is intended to assess the appropriateness of a potential roundabout installation at a particular location. BSC completed the Roundabout Installation Screening Form (RISF) for each of the three major project intersections at Mass Ave and Marrett Street, Maple Street, and Pleasant Street / Follen Road. These completed forms are included in the Appendix.

Based on the four (4) sections presented in the form, the user makes a guided decision for one of three selections as to the appropriateness of installing a roundabout:

- Candidate – Advance a roundabout design for further analysis and design if it meets the criteria for (1) space requirements and (2) one or more of the project objectives
- Conditional – Advance a roundabout design for further analysis and design under conditions
- Not Recommended – A roundabout is not recommended for further consideration if it fails to meet either (1) space requirements or (2) none of the project objectives.

Upon completing the form for each of the study intersections, it was determined that a roundabout is not recommended at the intersections of Mass Ave at Marrett Road or Mass Ave at Maple Street. A roundabout is a candidate at the intersection of Mass Ave at Pleasant Street / Follen Road.

6.3 Alternatives Analyses

The following section discusses several alternatives that are proposed at the three major study intersections of Mass Ave with Marrett Road, Maple Street, and Pleasant Street / Follen Road, as well as at the existing pedestrian crossing at the Waldorf School.

6.3.1 Mass Ave at Marrett Road

Alternative 1 – Retain Current Design

The first design alternative at this location is to retain the current design of the intersection and make no modifications. This location would remain as an unsignalized intersection, however BSC recommends changing the existing yield control to stop control for the Marrett Road approach.

Alternative 2 - Signalization

The second proposed alternative at the intersection of Mass Ave and Marrett Road involves constructing traffic signals at the intersection and re-aligning the intersection in order to direct Marrett Road perpendicularly into Mass Ave. This alternative proposes one general-use travel lane on Marrett Road eastbound. Mass Ave northbound would have one 10-foot wide left-turn lane and one 11-foot wide through lane, with 5-foot wide sidewalks and a 3-foot wide grass strip on both sides. Mass Ave southbound has one 11-foot wide general use travel lane, with a 6-foot wide sidewalk and 8-foot wide grass strip on both sides of the roadway. There is a 5-foot bicycle lane proposed on both sides of Mass Ave. A figure for this alternative is shown at the end of this section.

Alternative 3 - Roundabout

BSC investigated the possibility of constructing a roundabout at this intersection. Based on the daily volumes entering the intersection (over 15,000 vpd), it was determined that a single-lane roundabout could be adequate for this intersection[6]. A minimum inscribed diameter of 90 feet is typical for this type of roundabout; however a larger diameter would be required to accommodate large trucks. The necessary size diameter was not available within the existing right-of-way.

[6] Roundabouts: An Informational Guide, NCHRP Report 672, Second Edition, Transportation Research Board, 2010

6.3.2 Mass Ave at Maple Street

Alternative 1 – Retain Current Design

The first design alternative at this location is to retain the current design of the intersection and make no modifications. This location would remain as an unsignalized intersection with Maple Street under stop control.

Alternative 2 - Signalization

The second alternative for the intersection at Mass Ave and Maple Street involves constructing traffic signals at this location. Mass Ave northbound provides one 11-foot wide through lane and one 10-foot wide right-turn lane. Mass Ave southbound provides one 10-foot wide left turn lane and one 11-foot wide through lane. Maple Street westbound provides one 11-foot wide left-turn lane and one 11-foot wide right-turn lane. Both sides of Mass Ave provide 5-foot wide bicycle lanes in each direction, a minimum of 3-foot wide grass strips, and 6-foot wide sidewalks on both sides. The south side of Maple Street provides a 4-foot wide shoulder from Maple Street to the bridge, providing bicycle accommodation leading to the Minuteman Commuter Bikeway. A figure for this alternative is shown at the end of this section.

Alternative 3 – Roundabout

A roundabout alternative was considered for this location, which would consist of a 110-foot diameter single-lane roundabout with three legs. The Maple Street and Mass Ave southbound approaches are 15 feet wide, while the Mass Ave northbound approach is 17.5 feet wide. The travel lane width in the roundabout measures 20-feet wide. The center grass or landscaped island includes a concrete apron to allow for larger trucks to circulate. Crosswalks are provided across each leg. Additional right of way may be required to construct this roundabout. A figure for this alternative is shown at the end of this section.

6.3.3 Mass Ave at Pleasant Street / Follen Road

Alternative 1 – Retain Current Design

The first design alternative at this location is to retain the current design of the intersection and make no modifications. This location would remain as an unsignalized intersection with Follen Road and Pleasant Street under stop control.

Alternative 2 – Signalization

The second alternative at this location involves the construction of traffic signals at the intersection of Mass Ave and Pleasant Street. Follen Road intersects Pleasant Street under strop-control, west of the Mass Ave / Pleasant Street intersection. The Mass Ave northbound approach provides one 10-foot wide left-turn lane and one 11-foot through lane, with a 3-foot wide grass strip and 6-foot sidewalks on both sides. The Mass Ave southbound approach provides one 11-foot through lane and one 10-foot wide right-turn lane, with a 6-foot wide sidewalk. The Pleasant Street approach to Mass Ave provides one 11-foot left-turn lane and one 13-foot right-turn lane. The Follen Road approach to Pleasant Street provides one 16-foot wide general use travel lane. 5-foot wide bicycle lanes are provided on both sides of Mass Ave. A figure for this alternative is shown at the end of this section.

Alternative 3 – Roundabout

This alternative involves the construction of a 100-foot diameter single-lane roundabout with four legs – both sides of Mass Ave, Pleasant Street, and Follen Road. The center of the roundabout would include a 48-foot diameter grass or landscaped island with a 10-foot wide apron to allow for larger trucks to circulate. The width of the circulation lane would vary between 20-30 feet. The design would include a single lane approach on all legs, while an alternative to this design would include two approach lanes from Mass Ave southbound. Crosswalks would be provided on all four legs. A figure for this alternative is shown at the end of this section.

6.3.4 Pedestrian Signal at Waldorf School

There is an existing pedestrian crossing signal on Mass Ave at the Waldorf School that needs to be upgraded as part of the proposed roadway and intersection safety improvements along the Mass Ave corridor. The amount of time currently allotted to pedestrians with the existing signal is longer than needed to cross the roadway. The following sections describe the three alternatives that could be used to replace the existing signal

Alternative 1 - Flashing Warning Beacon

A flashing warning beacon consists of a flashing circular yellow signal for vehicles that would supplement the "Pedestrian (symbol)" warning sign. The beacon operates only when pedestrians push the button; otherwise the signal is dark (not illuminated). This alternative would emphasize the mid-block crosswalk, but would not provide vehicular stop control, or alert pedestrians to the walking phase.

Alternative 2 - Pedestrian Hybrid Beacon

A pedestrian hybrid beacon flashes a yellow signal to motorists upon actuation by pedestrians, and then flashes a red signal to motorists indicating them to stop. It alerts pedestrians to the walking phase by incorporating a walk / flashing don't walk signal. The beacon operates only when pedestrians push the button; otherwise the signal is dark (not illuminated). A "Crosswalk Stop on Red (symbol)" warning sign would be mounted adjacent to the Beacon face on each major street approach.

This type of pedestrian signal is relatively new and could be unfamiliar to motorists and pedestrians alike. Additionally, it would need to be warranted for implementation.

Alternative 3 - Full Pedestrian Signal

This alternative would replace in kind the existing pedestrian signal with upgraded signal timings and new signal and pedestrian heads. This alternative would be constantly illuminated, providing a green signal to major roads unless pedestrians place a call. This alternative would assign a right of way to pedestrians and bring motorists to a complete stop upon push button actuation. The pedestrian phase is a positive reinforcement for the pedestrians to cross the roadway. This signal would need to be fully warranted for implementation.

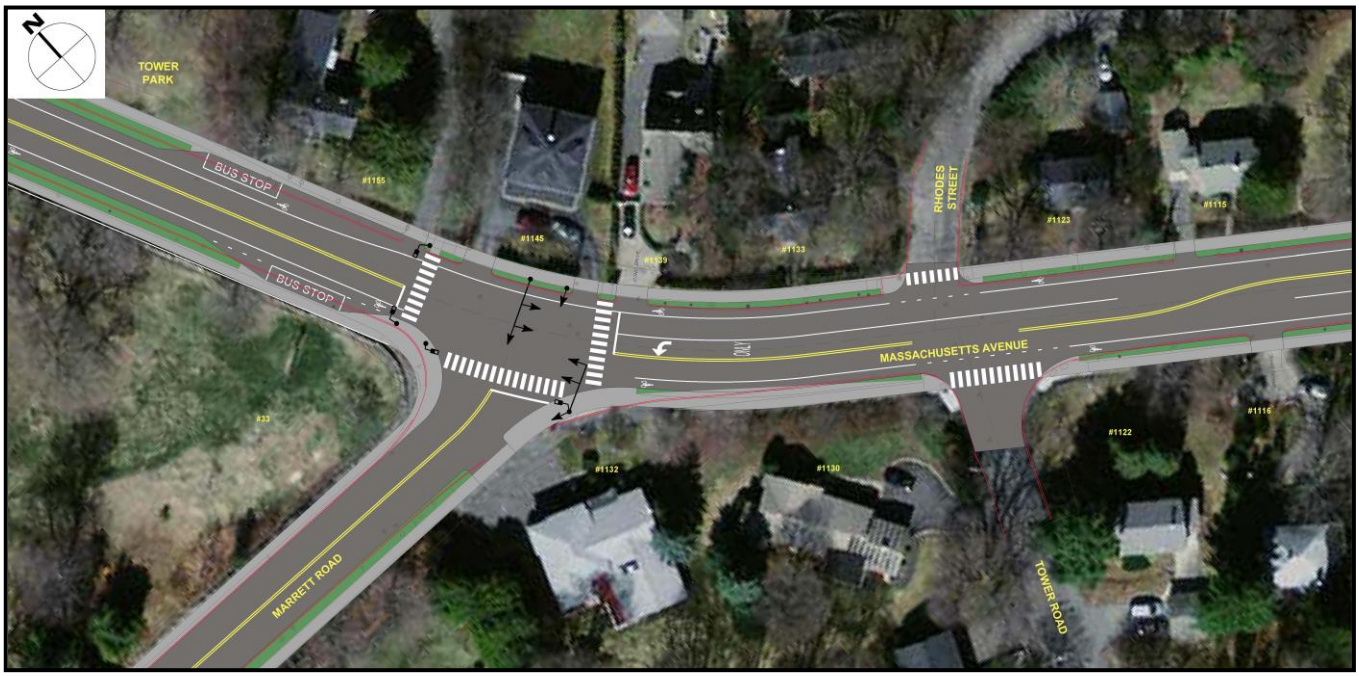
6.4 Traffic Control at Locust Ave / Fire Station

A Town of Lexington fire station is located at the southwest corner of the intersection of Mass Ave and Locust Ave. Locust Ave is a connecting route between Mass Ave and the adjacent neighborhood to the west, including Bowman Elementary School. Egress from the fire station is controlled by a flashing red light for both the Locust Ave and fire station approaches and a flashing yellow light for

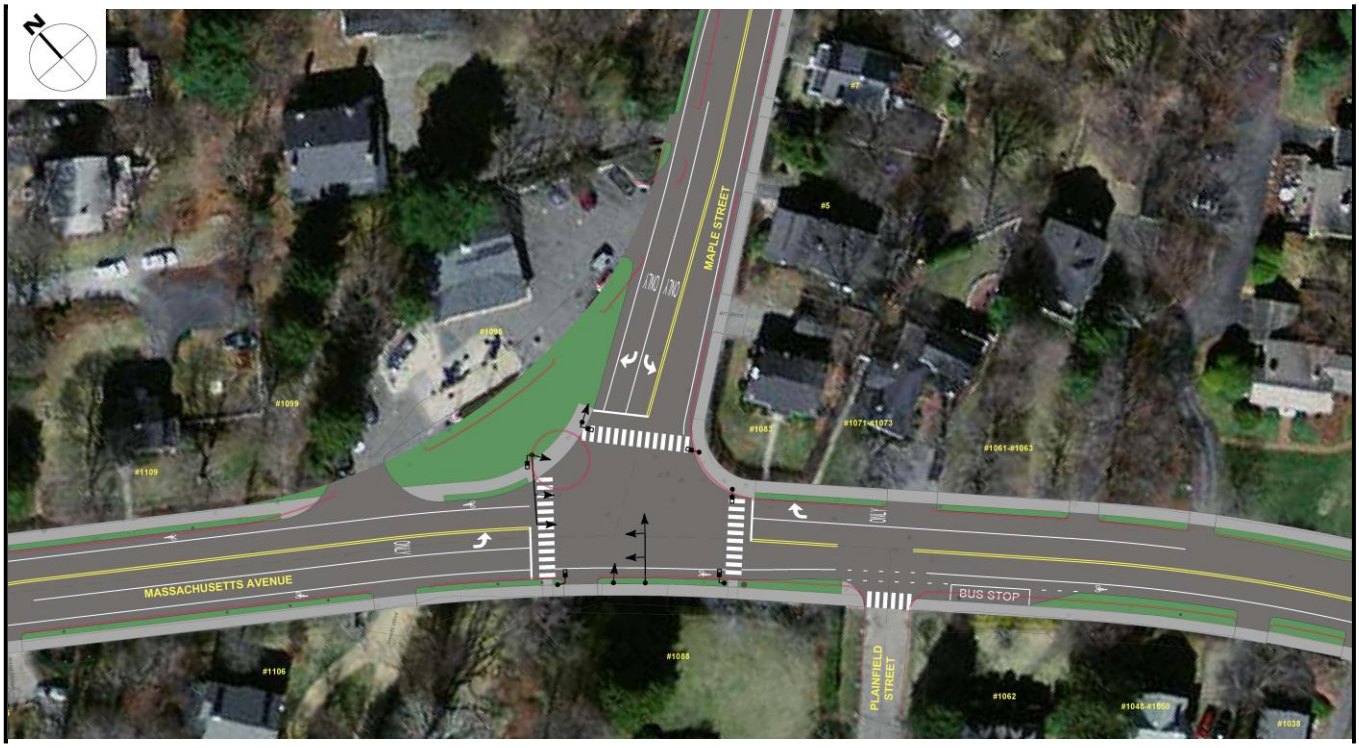
both Mass Ave approaches. Upon emergency pre-emption, both the Locust Ave and Mass Ave approaches turn solid red and the emergency vehicles are given the right of way.

There is an existing crosswalk on the southern leg of Mass Ave, between Locust Ave and the fire station driveway. This crosswalk provides a connection from the west side of Mass Ave to the Minuteman Bikeway located east of Mass Ave. The crosswalk is not equipped with a pedestrian signal.

The existing traffic signals are post-mounted and outdated. It is recommended to replace the existing 8” signal lenses with the current standard of 12”, which would improve visibility for drivers.

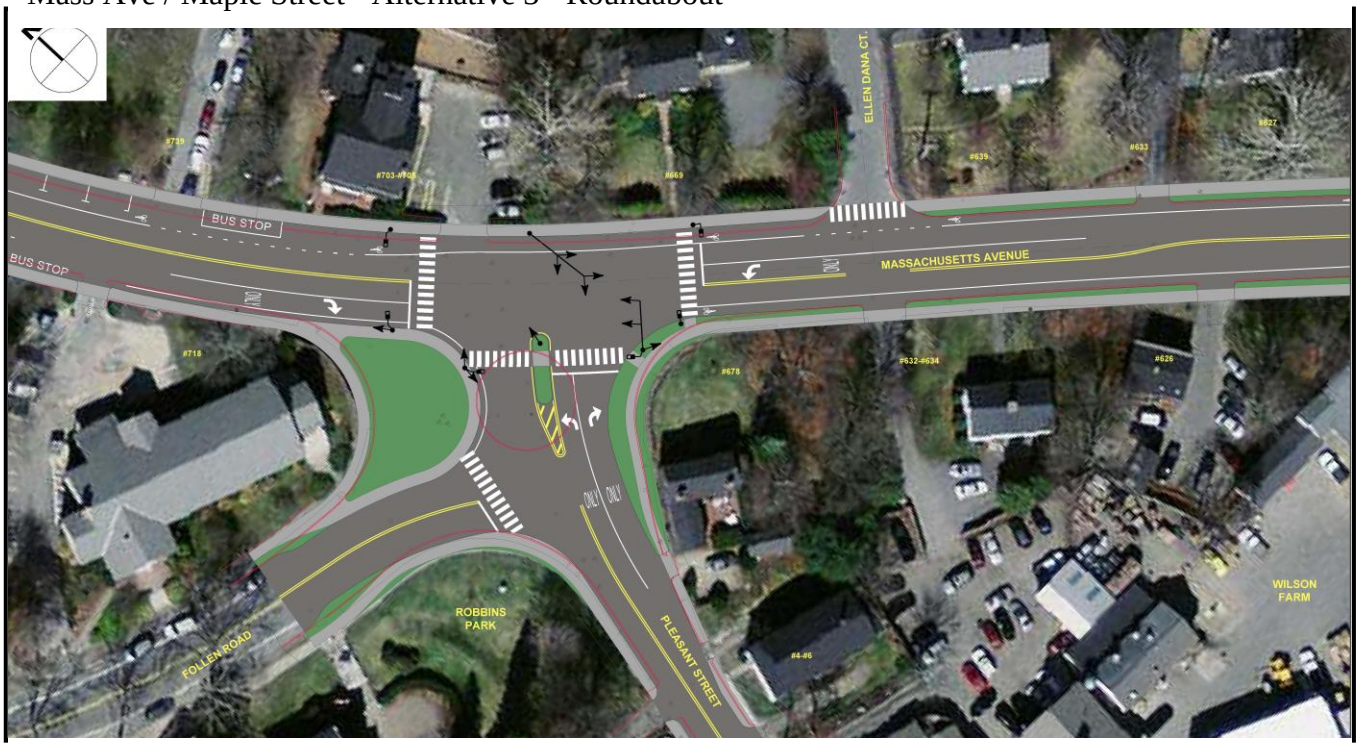


Mass Ave / Marrett Road - Alternative 2 - Signalization



Mass Ave / Maple Street - Alternative 2 - Signalization

Mass Ave / Maple Street - Alternative 3 - Roundabout



Mass Ave / Pleasant Street / Follen Road - Alternative 2 - Signalization

Mass Ave / Pleasant Street / Follen Road - Alternative 3 - Roundabout

6.5 Intersection Capacity Analyses for Alternatives

Tables 7 and 8 summarize the LOS for each alternative during the weekday morning and afternoon peak hours.

Mass Ave at Marrett Road

Under **Alternative 1 – Retain Current Design (No Build)**, the Marrett Road eastbound approach is expected to operate at LOS F during both the weekday morning and afternoon peak hours. Under **Alternative 2 – Signalization**, the intersection is expected to operate at an overall LOS D during both peak hours, with the Marrett Road approach operating at LOS D and E during the weekday morning and afternoon peak hours, respectively. An analysis was not conducted for **Alternative 3 – Roundabout** because space was not available within the existing right-of-way for the necessary diameter.

Mass Ave at Maple Street

The Mass Ave/Maple Street intersection is expected to operate at LOS F during both peak hours under **Alternative 1 – Retain Current Design (No Build).** The overall intersection is expected to operate at LOS C and D during the weekday morning and afternoon peak hours, respectively, under **Alternative 2 – Signalization.** Under this alternative, the Maple Street eastbound left-turn lane will operate at LOS D during the weekday morning peak hour and LOS E during the weekday afternoon peak hour. Under **Alternative 3 – Roundabout**, the intersection is expected to operate at an overall LOS F during both peak hours.

Mass Ave at Pleasant Street / Follen Road

The Mass Ave/Pleasant Street intersection is expected to operate at LOS F under **Alternative 1 – Retain Current Design (No Build)** during both the weekday morning and afternoon peak hours. Under **Alternative 2 – Signalization**, the overall intersection will operate at LOS B during the weekday morning and afternoon peak hours, respectively, with the Pleasant Street eastbound left-turn lane operating at LOS B and C during the weekday morning and afternoon peak hours, respectively.

During the weekday morning peak hour, the Follen Road southbound approach is expected to operate at LOS D under both **Alternative 1** and **Alternative 2**. During the weekday afternoon peak hour, this approach will operate at LOS C under both **Alternative 1** and **Alternative 2**.

Under **Alternative 3 – Roundabout**, the overall intersection at Mass Ave at Pleasant Street / Follen Road is expected to operate at LOS D during the weekday morning peak hour and LOS C during the weekday afternoon peak hour. Under this alternative, the Pleasant Street eastbound approach will operate at LOS B and D during the weekday morning and afternoon peak hours, respectively. The Follen Road southeastbound approach is expected to operate at LOS B during both peak hours.

Chapter 7: Recommendations

Chapter 6 discussed the proposed design alternatives provided for the three study area intersections and along the corridor of Mass Ave between Pleasant Street and Marrett Road. Based on geometry constraints, benefits to roadway users, and anticipated traffic operations, the recommended and preferred alternatives are discussed in the following section.

7.1 Mass Ave at Marrett Road

The preferred alternative at this location is **Alternative 1 – Signalization**. Based on preliminary design, in conjunction with the Roundabout Screening Tool, the roundabout alternative was deemed inappropriate for this location based on space constraints. Alternative 3 – Unsignalized intersection is a possible second option and may be considered as an interim option during construction and implementation of the entire corridor, but it would not provide for safe pedestrian accessibility and would not reduce delays at the intersection.

7.2 Mass Ave at Maple Street

The preferred alternative at this location is **Alternative 1 – Signalization**. In order to accommodate the number of vehicles entering this intersection, a roundabout would require two lanes of circulation for some movements. A roundabout of this size would not fit within the existing right-of-way constraints and therefore would require costly land takings.

7.3 Mass Ave at Pleasant Street / Follen Road

The preferred alternative at this location is **Alternative 1 – Signalization**. The Roundabout Screening Tool indicated that a roundabout is a candidate at this location. However, a review of the anticipated traffic operations for both the roundabout and signalization at this intersection indicate that signalization is the preferred alternative. Additionally, pedestrian crossings for a roundabout would be located farther from the Mass Ave corridor than with a signalized alternative.

Police traffic management activities at this location occur during parades or events at the Waldorf School or area churches. A traffic signal is more conducive to this traffic management than a roundabout.

The current practice is that parents of students at the Waldorf School queue in the school driveway while waiting to pick up their children from school in the afternoon. Often, these queues spill back into the Mass Ave northbound travel lane. A traffic signal would provide more storage on Mass Ave for this queuing than would a roundabout.

7.4 Construction and Implementation

The preferred alternative for all three study area intersections is to provide traffic signals, and the capacity analyses reviewed the corridor as if all three intersections would be signalized at the same time. BSC recommends constructing all three signals at the same time, in order to fully implement coordination between the intersections.

7.5 Pedestrian Signal at Waldorf School

There is an existing pedestrian crossing signal on Mass Ave at the Waldorf School that needs to be upgraded as part of the proposed roadway and intersection safety improvements along the Mass Ave corridor. The Town of Lexington currently uses flashing warning beacons at many locations throughout the town and desires to use this type of control at the Waldorf School pedestrian crossing as well. However, per comments from MassDOT, Rectangular Rapid Flashing Beacons (RRFB), will be proposed for this location. The RRFB consists of alternating flashing rectangular yellow beacons, supplementing a "Pedestrian (symbol)" warning sign. The RRFB is activated by pedestrian pushbutton.

7.6 Traffic Control at Locust Ave / Fire Station

The recommended improvement at this intersection is to replace the existing 8" traffic signal lenses with the current 12" standard. An additional traffic signal head should be installed for the Fire Station egress.

Project Data

A Road Safety Audit for the intersection of Massachusetts Avenue and Maple Street was held on April 17, 2012 at the Town Hall in Lexington, MA. As indicated in Table 1, the audit team consisted of representatives from State, Regional and Local agencies and included a cross-section of engineering, planning and emergency response expertise.

Table 1. Participating Audit Team Members

Audit Team Member	Agency/Affiliation
Lisa Schletzbaum	MassDOT Highway Division – Safety Section
John Livsey	Town of Lexington – Town Engineer
John Fleck	Town of Lexington – Fire
Marc Valenti	Town of Lexington – Highway Superintendent
Bill Hadley	Town of Lexington – Director of Public Works
Aaron Henry	Town of Lexington – Planning
John Mazerall	Town of Lexington – Police
Chen-Yuan Wang	CTPS (Boston Region MPO)
Sara Timoner	MassDOT Highway Division – District 4 Traffic

Dominic Caiazzo	MassDOT Highway Division – Safety Section
Douglas Halpert	MassDOT Highway Division – Safety Section
Greg Lucas	BETA Group, Inc.
Jaklyn Centracchio	BETA Group, Inc.

Background

The Federal Highway Administration defines a Road Safety Audit (RSA) as *the formal safety examination* of an existing or future road or intersection by an *independent, multidisciplinary team*. The purpose of an RSA is to *identify potential safety issues and possible opportunities for safety improvements* considering all roadway users. A Road Safety Audit was scheduled for the intersection of Massachusetts Avenue and Maple Street as required by MassDOT Highway Safety Improvement Program (HSIP) guidelines. A Private design consultant is under contract with the Town of Lexington to design roadway improvements for Massachusetts Avenue from Marrett Road to Pleasant Street. The intersection of Massachusetts Avenue and Maple Street has been identified as a high crash location in the Boston Region MPO and would be eligible for Federal Highway Safety Improvement Program (HSIP) funds for construction, provided that the proposed improvements enhance safety. The RSA is intended to identify both short and long term safety improvements that can be made at the subject intersection prior to the proposed project and/or incorporated into the proposed project.

Project Description

Massachusetts Avenue at Maple Street

The intersection of Massachusetts Avenue and Maple Street, shown in Figure 1, is located in the eastern part of Lexington. Massachusetts Avenue is functionally classified as an Urban Principal Arterial, while Maple Street is classified as an Urban Minor Arterial. Both roadways are under Town of Lexington jurisdiction in the vicinity of the intersection, although Maple Street is state-owned further north of the intersection. The intersection carries three state-numbered routes: Routes 4 and 225 follow Massachusetts Avenue through the intersection, while Route 2A joins Massachusetts Avenue from its intersection with Marrett Road approximately 600 feet to the northwest, then departs Massachusetts Avenue via Maple Street northward. The intersection serves several important regional connections; Massachusetts Avenue connects Lexington Center to Arlington, Cambridge and Boston to the southeast; while Maple Street carries traffic from residential areas of Lexington and Winchester to MA Route 2 and I-95/Route 128. Vehicles follow Maple Street to Massachusetts Avenue and then to Pleasant Street approximately ½ mile southeast of Maple Street to access Route 2, while vehicles bound for I-95/Route 128 may follow the same route and follow Route 2 west, or follow Massachusetts Avenue to Marrett Road to its interchange with I-95. The Minuteman Bikeway, an 11-mile bicycle trail through Bedford, Lexington, Arlington and Cambridge, runs essentially parallel to Massachusetts Avenue and has access to Maple Street from an underpass approximately 400 feet north of the study intersection. It was noted that despite the proximity of the Bikeway, there is a significant amount of bicycle traffic in both directions on Massachusetts Avenue through the intersection.

Massachusetts Avenue at Maple Street

ROAD SAFETY AUDIT

LEXINGTON, MA

Figure 1

Location Map

Massachusetts Avenue and Maple Street form a 3-way T-type intersection with a circular island separating the approach and departure lanes of the Maple Street leg. No traffic control devices are provided at the intersection. Massachusetts Avenue runs generally northwest-southeast through the intersection but is generally an east-west route through the region; for clarity purposes, this report will refer to it as an east-west route. Massachusetts Avenue eastbound provides two narrow lanes, a left turn lane and a through lane, while Massachusetts Avenue westbound provides a single general purpose lane. Maple Street has a wide departure lane on the south side of the circular median and separate left and right turn approach lanes on the north side of the median, with the left and right turn lanes separated by a painted gore area. Maple Street widens from a typical width of approximately 28 feet north of the intersection to approximately 200 feet at the gutter line to Massachusetts Avenue; the end result is a wide expanse of pavement that allows turning movements from a wide range of entry points and at great variances in vehicle speed. This wide expanse of pavement also proves challenging for pedestrians and bicyclists attempting to cross Maple Street to continue along Massachusetts Avenue.

Sidewalks are provided along both sides of Massachusetts Avenue and along the east side of Maple Street in the vicinity of the intersection. No crosswalks are provided at the intersection, although crosswalks are provided across Massachusetts Avenue at its intersection with Plainfield Street approximately 80 feet east of Maple Street, and at its intersection with Tower Road approximately 300 feet west of Maple Street. Both crosswalks are at the location of MBTA bus stops for Routes 62 and 76, which follow Massachusetts Avenue through Lexington.

Land use in the area is primarily residential, with the exception of an automotive service center on the northeast corner of the intersection. It was noted that a recent request for a change in zoning for the service center property was denied by the Town.

Crash data were provided by the Lexington Police Department and summarized by MassDOT. There were a total of eighteen reported and police documented crashes at the intersection within the period from January 2008 to December 2011. Crashes documented by operators only were not reviewed. During the three year period from 2007 to 2009, there were 29 police and operator reported crashes located to the study intersection. The crash summary shows that thirteen of the eighteen crashes (72%) were angle crashes. Eight of the thirteen angle crashes involved a vehicle turning left from Maple Street to Massachusetts Avenue eastbound, with five colliding with an eastbound vehicle and three colliding with a westbound vehicle. Two crashes involved a bicycle traveling west on Massachusetts Avenue, one involving a vehicle turning left onto Maple Street and the other involving a vehicle departing Maple Street. The right lane from Maple Street to Massachusetts Avenue westbound experienced four crashes – two angle crashes involving a turning vehicle and a through vehicle, and two rear-end crashes between vehicles waiting to merge onto Massachusetts Avenue. Rear-end crashes with this type of geometry typically occur when two drivers are both looking to the left for an available gap, and the following driver assumes the lead driver will go and accelerates before the lead driver has accelerated. An additional rear-end crash included in the intersection summary occurred at the crosswalk crossing Massachusetts Avenue at Plainfield Street. Crash data summaries and a collision diagram are included in the Appendix.

Speed regulations maintained by MassDOT Highway Division establish a 30 MPH speed limit for Massachusetts Avenue from Maple Street to Marrett Road, and a 35 MPH speed limit for Massachusetts Avenue southeast of Maple Street. Complete speed regulations for Massachusetts Avenue in Lexington are included in the Appendix.

Audit Observations

Following a brief introduction to the RSA process and a summary of existing geometry, crash and speed regulation information, audit participants were asked to discuss safety issues at the intersection of Massachusetts Avenue and Maple Street. Audit participants then conducted a site visit as a group, at which time they offered observations on safety concerns and deficiencies. A summary of those major safety considerations is as follows:

- Lack of Traffic Control – No traffic control devices are provided at the intersection. The left turn from Maple Street generally operates as a STOP-controlled approach, although neither a STOP sign or a painted STOP bar are provided. The right turn from Maple Street to Massachusetts Avenue westbound generally operates as a yield, but the lack of yield sign or yield markings may give vehicles on Maple Street the false sense that they have the right of way. A number of crashes at the intersection may be attributed to the lack of traffic control, especially the four crashes related to the right turn lane from Maple Street.

- Excessive Delay–Audit participants familiar with the intersection operation stated that traffic congestion is a significant issue during peak periods. It was noted that long queues develop on Maple Street and that driver aggression and frustration may be a contributing factor to the crash history of the intersection. It was noted that the nearby intersection of Massachusetts Avenue and Pleasant Street has similar characteristics and may contribute to the level of driver frustration.

- Narrow Lane Widths – The two-lane section of Massachusetts Avenue eastbound approaching the intersection provides narrow lanes for turning vehicles and for through vehicles. Although lane widths were not measured on the day of the audit, they appear to be 10-feet or less in width. This may be a factor in the sideswipe crash in this area, which involved vehicles traveling in the opposite direction. It was noted that the left turn lane was added approximately five years ago to increase capacity, but that the modification was completed by restriping the roadway without widening.

- Pedestrian Accommodations – A number of safety issues related to pedestrian accommodations were discussed during the audit.

    - No crosswalks are provided across Massachusetts Avenue or Maple Street at the intersection. Pedestrians are accommodated at crosswalks adjacent to MBTA bus stops both east and west of the intersection on Massachusetts Avenue, although this does not address pedestrians needing to cross Maple Street in order to follow Massachusetts Avenue on its north side.

- The excessive width of Maple Street provides a challenge for pedestrians and bicyclists, who must cross both a wide departure lane with vehicles turning from a wide range of entry points and at a great variance in speeds, and a wide approach area with two separate turning lanes and a wide, unprotected painted gore area. This may be a factor in the two bicycle crashes that occurred at the intersection.

- Handicap ramps are not provided at the crosswalk at Plainfield Street. It should be noted that handicap ramps are provided at the crosswalk crossing Massachusetts Avenue west of Maple Street at Tower Road.

- Pedestrian warning signs are not provided for the crosswalks crossing Massachusetts Avenue at Plainfield Street and at Tower Road. This may be a factor in the rear-end crash at the Plainfield Street crosswalk.

- Visibility – A number of safety issues related to visibility for turning vehicles were discussed at the audit.

  - The marked left turn lane from Massachusetts Avenue eastbound to Maple Street is approximately 150 feet in length, but ends at a point adjacent to the southern edge of the painted gore on the Maple Street approach in order to avoid conflicts between vehicles turning left from Massachusetts Avenue and vehicles turning left from Maple Street. A vehicle turning left from Massachusetts Avenue must travel approximately two to three car lengths beyond the end of the turn lane before making the turn onto Maple Street, and vehicle queues often start at the point where vehicles turn from, not the point where the turn lane ends. As a result, left turn queues from Massachusetts Avenue block left turns from Maple Street. In instances where vehicles in queue leave gaps for vehicles from Maple Street, the cars in queue present visibility constraints for turning vehicles. The blockage of turning movements and constrained visibility are likely a factor in the angle crashes involving left turning vehicles.

  - A utility pole and signs located in the circular median constrain visibility of westbound traffic for vehicles turning left from Maple Street.

  - A utility pole and hedges on the southeast corner of the intersection restrict potential visibility of pedestrians on the sidewalk for vehicles turning right from Massachusetts Avenue westbound to Maple Street.

- Signage – In addition to the visibility issues noted above related to signage in the median, it should be noted that the object marker sign in the median violates MassDOT guidelines and should be removed. The Massachusetts amendments to the Manual on Uniform Traffic Control Devices (MUTCD) state that an H1-2 warning cluster panel should be used in place of MUTCD standard object markers, and that H1-2 panels shall be used only where traffic can pass on both sides (immediately to the right or left side) of a gore, island, or other obstruction. The H1-2 object marker on this island is visible to eastbound vehicles on Massachusetts Avenue, who can only pass to the right side of the island when turning to Maple Street.

- Bicycle Accommodation – As previously noted, the excessive width of the Maple Street approach to Massachusetts Avenue presents a challenge to bicycles traveling along the north side of Massachusetts Avenue. It was also noted that while shared lane use is permitted along Massachusetts Avenue, lane and shoulder widths do not meet state guidelines for bicycle accommodation. This may be a contributing factor to the two bicycle crashes at the intersection.

- Speeding – Speed was noted as a concern, both for through traffic along Massachusetts Avenue and for turning traffic. The wide departure lane for Maple Street allows vehicles to navigate both left and right turns from Massachusetts Avenue at a high rate of speed.

- Service station – The automotive service station on the northeast corner of the intersection has three curb cuts along the Maple Street right turn lane. It was noted that vehicles exiting the service station to go east on Massachusetts Avenue cross the painted median separating the left and right turn lanes from Maple Street, which can create conflicts and additional visibility constraints for both left and right turning vehicles. Vehicles leaving the service station to go north on Maple Street must cross the wide approach lane, and may not be able to see cars approaching from the north on Maple Street or turning from Massachusetts Avenue. Finally, it was noted that vehicles parked on the northwest corner of the property are parked such that they must back out into the right turn lane from Maple Street to exit the parking space. Town personnel noted that the vehicle typically parked in this spot, including on the day of the audit, belongs to the owner of the service station.

- Emergency Signal – Although outside the limits of the intersection and beyond the limits of the reconstruction project along Massachusetts Avenue from Marrett Road to Pleasant Street, safety issues related to the existing emergency signal at the East Lexington fire station approximately 2.5 miles to the east were discussed during the audit. It was noted that the existing signals are post-

mounted with 8" heads, which provides reduced visibility when compared to standard 12" heads mounted overhead. It was noted that vehicles frequently run the red signal, especially during times when the signal is active but a fire vehicle is not leaving the station with lights flashing, such as when the vehicle backs in upon its return to the station.

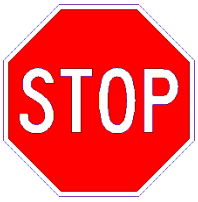
Potential Safety Enhancements

After the site visit, audit participants returned to the meeting location to discuss the safety issues and consider improvements. Audit participants were encouraged to consider both short and long term improvements for each issue. Each improvement considered has been categorized as short-term, mid-term, or long-term based on the definitions shown in Table 2. Additionally, a cost category has been assigned to each improvement based on the parameters set forth in Table 2.

Table 2. Estimated Time Frame and Costs Breakdown

Time Frame		Costs	
Short-term	<1 year	Low	<$10,000
Mid-term	1–3 years	Medium	$10,000–$50,000
Long-term	>3 years	High	>$50,000

The following improvements were suggested by audit participants to improve safety issues associated with the intersection of Massachusetts Avenue and Maple Street.



- Install STOP and Yield signs for the Maple Street approach. The left turn from Maple Street to Massachusetts Avenue generally operates under STOP control, and should have a STOP sign installed. A Yield sign should be installed for the right turn lane from Maple Street to Massachusetts Avenue westbound. This is a low cost improvement that should be implemented immediately in advance of long-term improvements at the intersection.

- Improve control by considering a traffic signal or roundabout. It was noted that the planned reconstruction project from Maple Street to Pleasant Street is currently at the 25% design stage and is considering concepts for improvements to both the Maple Street and Pleasant Street intersections. The design should consider traffic signal installation along with geometric improvements discussed in detail below. It was noted that the proposed reconstruction project may also consider a roundabout for the intersection of Massachusetts Avenue and Maple Street. A roundabout would address visibility issues at the intersection, but may present challenges to pedestrians when compared to a traffic signal because of the lack of a protected crossing. In some cases, a roundabout design improves safety when compared to a signal. It was noted that construction of a roundabout may require property acquisition on the northeast corner of the intersection. The design should follow established state guidelines for roundabouts by providing proper deflection for the entering roadways. This is a long-term, high cost improvement, regardless of the reconstruction strategy considered. If a traffic signal is constructed, it should include emergency preemption equipment.

- Widen Massachusetts Avenue between Marrett Road and Maple Street. The short segment of Massachusetts Avenue between these two roadways includes the two lane approach section at Maple Street. This segment should be widened to provide lane and shoulder widths meeting state guidelines. This long-term, high cost improvement can be incorporated into traffic signal improvements at the intersection, but may not be required if a roundabout is constructed.

- Reduce width of the Maple Street approach. The excessive width creates a number of potential safety issues documented in this report. A significant reduction in width can be achieved while still maintaining adequate turning radii and lane widths to allow all existing turning movements. A beneficial side effect is the creation of additional green space at the intersection. This is a long-term, high cost improvement that can be incorporated into other improvements proposed at the intersection.

- Provide "Share The Road" signage along Massachusetts Avenue. It was noted that despite the proximity of the Minuteman Bikeway, a significant number of cyclists choose to ride along Massachusetts Avenue through the study intersection. It was suggested that drivers should be alerted to the presence of these cyclists by installation of "Share The Road" signs. This is a short-term, low cost improvement.

- Provide W11-2 pedestrian warning signs for the existing crosswalks at Plainfield Street and Tower Road. It was noted that the Town has installed yellow-green fluorescent pedestrian warning signs with a W16-7p arrow panel at a number of crosswalks town-wide. Similar signs should be installed at these two crosswalks to increase awareness of the potential for pedestrians to be in the roadway. This is a short-term, low cost improvement.

- Install handicap ramps for the crosswalk at Plainfield Street. This is a short-term, medium cost improvement that can be incorporated into proposed improvements along the corridor.

- Determine long-term strategies for pedestrian access. Some audit participants suggested that intersection improvements at the Maple Street intersection should include pedestrian crosswalks across Massachusetts Avenue, while others suggested that pedestrian crossings of Massachusetts Avenue continue to be accommodated via the existing crossings at Plainfield Street and Tower Road. The proposed reconstruction project should consider the location of existing and proposed crosswalks based on pedestrian desire lines and existing pedestrian counts, as well as the location of bus stops. This is a mid-term, potentially high cost improvement.

- Relocate utility pole located within the existing circular island on Maple Street. The utility pole creates visibility constraints for vehicles waiting to turn left onto Massachusetts Avenue. This utility pole should be relocated as part of any improvements considered for the intersection. This is a potentially short-term, low cost improvement that will be incorporated into other long-term improvements.

- Remove H1-2 object marker from the circular island. This sign is not in compliance with the Massachusetts amendments to the MUTCD and should be removed. This is a short-term, low cost improvement.

- Widen Massachusetts Avenue to provide bicycle accommodation. In addition to the specific intersection improvements aimed at improving bicycle access, overall corridor improvements should include lane and shoulder widths meeting state standards for bicycle accommodation. This is a long-term, high cost improvement.

- Enforce speed at and in the vicinity of the intersection. Police enforcement carries no additional cost, but will result in decreased enforcement elsewhere in the Town. It was also noted that installation of a roundabout would likely decrease speeds along Massachusetts Avenue.

- Trim hedges along the southeast corner. Vegetation along the back of sidewalk currently presents a potential sight distance obstruction. Geometric improvements may reduce or eliminate the need to trim these hedges. This is a short term, low cost improvement.

- Consider restricting left turns from the center service station driveway. The service station has three separate curb cuts along Maple Street that directly abut the right turn lane from Maple Street to Massachusetts Avenue. Vehicles exiting the center driveway must turn across the wide Maple Street approach or across the painted gore area separating the left and right turn lanes, presenting additional conflict points with turning vehicles. It was suggested that restricting this center driveway as a right in/right out driveway would eliminate these potential conflicts. This is a short-term, low cost improvement.

- Install overhead signal heads with 12” LED lenses for the East Lexington fire station on Massachusetts Avenue. Although not located within the audit study area, the audit team discussed improvement strategies related to the existing emergency signal at the East Lexington fire station. Mast arms supporting overhead signal heads with 12” LED lenses should be installed at this location to increase visibility of the signal for approaching vehicles. This is a long-term, high cost improvement. Existing ground-mounted heads could be replaced with new heads with 12” LED lenses as an interim short-term measure.

Summary of Road Safety Audit

Table 3 summarizes potential recommendations discussed by the audit team. The recommendations are categorized based on the potential safety payoff, as well as by time frame and cost. The safety payoff is a qualitative judgment of the effectiveness of the potential safety improvements. Each recommendation has a responsibility assigned to it stating whether MassDOT or the Town of Lexington would be responsible for implementing the recommended improvement. "Project" refers to improvements that are assumed to be included or could reasonably be accommodated as part of proposed improvements at the intersection. Costs provided for "Project" improvements are an order of magnitude estimate which estimates the cost of the improvement if completed independent of the project.

Table 3. Potential Safety Enhancement Summary

Safety Issue	Safety Enhancement	Responsibility	Safety Payoff	Time Frame	Cost
Lack of Traffic Control	Install STOP and Yield signs for the Maple Street approach.	Town	High	Short-term	$1,000
Lack of Traffic Control, Excessive Delay, Pedestrian Accommodations, Visibility, Speeding	Improve control by considering installation of a traffic signal or roundabout. If a traffic signal is installed, it should include emergency preemption.	Project	High	Long-term	TBD
Narrow Lane Widths, Bicycle Accommodation	Widen Massachusetts Avenue between Marrett Road and Maple Street. This improvement is intended to specifically address the narrow lane widths of the existing two lane approach at Maple Street.	Town	Medium	Long-term	$200,000
Pedestrian Accommodations, Visibility, Speeding	Reduce width of the Maple Street approach.	Project	High	Long-term	TBD
Bicycle Accommodations	Provide “Share The Road” signage along Massachusetts Avenue.	Town	Medium	Short-term	$2,000
Pedestrian Accommodations	Provide W11-2 pedestrian warning signs with W16-7p arrow panels for the existing crosswalks at Plainfield Street and Tower Road.	Town	Medium	Short-term	$3,000
Pedestrian Accommodations	Install handicap ramps for the crosswalk at Plainfield Street.	Town	Low	Short-term	$10,000
Pedestrian Accommodations	Determine long-term strategies for pedestrian access. This improvement includes conducting pedestrian counts and studying pedestrian travel patterns.	Town/Project	Medium	Mid-term	TBD
Visibility	Relocate utility pole located within the existing circular island on Maple Street. (This improvement will be incorporated into other geometric improvements at the intersection.)	Town/Project	Medium	Long-term	*
Signage	Remove H1-2 object marker from the circular island.	Town	Low	Short-term	$500
Bicycle Accommodation	Widen Massachusetts Avenue to provide bicycle accommodation.	Project	Medium	Long-term	TBD

Table 3. Potential Safety Enhancement Summary

Safety Issue	Safety Enhancement	Responsibility	Safety Payoff	Time Frame	Cost
Speeding	Enforce speed at and in the vicinity of the intersection.	Town	Medium	Short-term	$0 (Reduced enforcement elsewhere)
Visibility	Trim hedges along the southeast corner of the intersection.	Town	Medium	Short-term	$500
Service Station	Consider restricting left turns from the center service station driveway.	Town	Medium	Short-term	$1,000
Emergency Signal	Install overhead signal heads with 12” LED lenses for the East Lexington fire station.	Town	High	Long-term	$50,000 **
Emergency Signal	Replace ground-mounted signal heads with new heads with 12” LED lenses.	Town	Medium	Short-term	$5,000 **

* Improvements to be incorporated into the proposed project are assumed to be included as part of the overall project cost.

** These safety issues and improvements were discussed at the audit, but are outside of the limits of the proposed reconstruction project.

Appendix A. RSA Meeting Agenda

Agenda

Road Safety Audit

Lexington

Massachusetts Avenue at Maple Street

Meeting Location: Samuel Hadley Public Services Building, 201 Bedford Street, 2nd floor conference room**, Lexington, MA**
Tuesday, April 17, 2012
10:00 AM – 12:00 noon

Type of meeting:	**High Crash Location – Road Safety Audit**
Attendees:	**Invited Participants to Comprise a Multidisciplinary Team**
Please bring:	**Thoughts and Enthusiasm!!**
10:00 AM	**Welcome and Introductions**
10:15 AM	**Discussion of Safety Issues** • Crash history, Speed Regulations – provided in advance • Existing Geometries and Conditions
11:00 AM	**Site Visit** • Drive to the intersection of Mass. Ave at Maple St • As a group, identify areas for improvement
11:30 AM	**Discussion of Potential Improvements** • Discuss observations and finalize safety issue areas • Discuss potential improvements and finalize recommendations
12:00 noon	**Adjourn for the Day – but the RSA has not ended**

Instructions for Participants:

- **Before attending the RSA on April 17th, participants are encouraged to drive/walk through the intersection and complete/consider elements on the RSA Prompt List with a focus on safety.**
- **All participants will be actively involved in the process throughout. Participants are encouraged to come with thoughts and ideas, but are reminded that the synergy that develops and respect for others' opinions are key elements to the success of the overall RSA process.**
- **After the RSA meeting, participants will be asked to comment and respond to the document materials to assure it is reflective of the RSA completed by the multidisciplinary team.**

Appendix D. Speed Regulations

NO. 158

THE COMMONWEALTH OF MASSACHUSETTS

DEPARTMENT OF PUBLIC WORKS

SPECIAL REGULATION GOVERNING THE SPEED OF MOTOR VEHICLES ON TOWN WAYS, IN THE TOWN OF LEXINGTON

April 22, 1958

SPECIAL SPEED REGULATION NO. 158

Highway Location: LEXINGTON

Authority in Control: TOWN OF LEXINGTON

Name of Highway: Massachusetts Avenue, Bedford Street, Waltham Street, Woburn Street, Lowell Street, Watertown Street, Pleasant Street, Hancock Street, Adams Street, Lincoln Street, School Street, Spring Street, East Street, Grant Street and Wood Street

In accordance with the provisions of Section 18 of Chapter 90 of the General Laws (Ter. Ed.), as amended by Section 2 of Chapter 564 of the Acts of 1948, the following Special Speed Regulations made by the Board of Selectmen of the Town of Lexington shall be effective immediately upon compliance with the applicable provisions of the above-referenced Section 2.

The following designated speed limits are established at which motor vehicles may be operated in the areas described:

MASSACHUSETTS AVENUE-EASTBOUND

Beginning at Marrett Road (Route 2A),

thence easterly	0.13	miles at	30	miles per	hour	
thence	1.38	"	" 35	"	"	"
"	0.39	"	" 30	"	"	"
"	0.31	"	" 25	"	"	"
"	0.29	"	" 30	"	"	"
"	1.15	"	" 35	"	"	"
"	0.43	"	" 30	"	"	"
"	0.59	"	" 35	"	"	" to the Arlington line; the

total distance being 4.67 miles.

MASSACHUSETTS AVENUE-WESTBOUND

Beginning at the Arlington line,

thence westerly	0.59	miles at	35	miles per	hour	
thence	0.43	"	" 30	"	"	"
"	1.15	"	" 35	"	"	"
"	0.29	"	" 30	"	"	"
"	0.31	"	" 25	"	"	"
"	0.39	"	" 30	"	"	"
"	1.38	"	" 35	"	"	"
"	0.13	"	" 30	"	"	" to Marrett Road (Route 2A);

the total distance being 4.67 miles.

JUL 9 2007

THE COMMONWEALTH OF MASSACHUSETTS
HIGHWAY DEPARTMENT
TOWN OF LEXINGTON
SPECIAL SPEED REGULATION # 158-C

Highway Location:	LEXINGTON
Authority In Control:	TOWN OF LEXINGTON
Name of Highway (s):	MASSACHUSETTS AVENUE WALTHAM STREET BEDFORD STREET

In accordance with the provisions of Chapter 90, Section 18, of the General Laws (Ter. Ed.) as amended, the following Special Speed Regulation is

Hereby Adopted

by the Board of Selectmen

of the Town of Lexington

Special Speed Regulation number 158, dated April 22, 1958 is hereby amended on Massachusetts Avenue and Waltham Street as follows, and Special Speed Regulation 158-A, dated October 1, 1973 is hereby amended by striking out the regulation in its entirety and inserting in place thereof the following revisions and addenda:

That the following speed limits are established at which motor vehicles may be operated in the areas described:

MASSACHUSETTS AVENUE - EASTBOUND

By striking out the clauses reading:

0.39 miles at 30 miles per hour
0.31 miles at 25 miles per hour
0.29 miles at 30 miles per hour

And inserting in place thereof:

0.26 miles at 30 miles per hour
0.57 miles at 25 miles per hour
0.16 miles at 30 miles per hour

MASSACHUSETTS AVENUE - WESTBOUND

By striking out the clauses reading:

0.29 miles at 30 miles per hour
0.31 miles at 25 miles per hour
0.39 miles at 30 miles per hour

And inserting in place thereof:

0.16 miles at 30 miles per hour
0.57 miles at 25 miles per hour
0.26 miles at 30 miles per hour

WALTHAM STREET – NORTHBOUND

By striking out the clause reading:

0.31 miles at 30 miles per hour to Massachusetts Avenue; the total distance being 2.54 miles.

And inserting in place thereof:

0.24 miles at 30 miles per hour
0.07 miles at 25 miles per hour ending at the junction of Massachusetts Avenue; the total distance being 2.54 miles.

WALTHAM STREET – SOUTHBOUND

By striking out the clause reading:

Beginning at Massachusetts Avenue, thence southerly
0.31 miles at 30 miles per hour

And inserting in place thereof:

Beginning at the junction of Massachusetts Avenue, thence southerly on Waltham Street
0.07 miles at 25 miles per hour
0.24 miles at 30 miles per hour

Appendix E: Warrant Analysis

HCS 2010: MUTCD Signal Warrants Release 6.40

Analyst: JML
Agency: BSC Group
Date: 10/26/2011
Project ID: 28280.00 East Lexington
EW Street: Maple Street

Intersection: Mass Ave at Maple St
Jurisdiction: District 4
Units: U.S. Customary
Analysis Year: 2011
NS Street: Massachusetts Avenue

General Information

Major St. Speed (mph): 0
Nearest Signal (ft): 0
Crashes per Yr: 0

Population: Not less than 10000
Coordinated Signal System: N

School Crossing

Students in Highest Hour: 0
Adequate Gaps in Period: 0
Minutes in Period: 0

Roadway Network

Two Major Routes: 1
Weekend Count: 0
5-yr Growth Factor: 0

Geometry and Traffic

HCS 2010: MUTCD Signal Warrants Release 6.40

Analyst: JML
Agency: BSC Group
Date: 10/26/2011
Project ID: 28280.00 East Lexington
EW Street: Marrett Road

Intersection: Mass Ave at Marrett Rd
Jurisdiction: District 4
Units: U.S. Customary
Analysis Year: 2011
NS Street: Massachusetts Avenue

General Information

Major St. Speed (mph): 0
Nearest Signal (ft): 0
Crashes per Yr: 0

Population: Not less than 10000
Coordinated Signal System: N

School Crossing

Students in Highest Hour: 0
Adequate Gaps in Period: 0
Minutes in Period: 0

Roadway Network

Two Major Routes: 1
Weekend Count: 0
5-yr Growth Factor: 0

Appendix F: Roundabout Installation Screening Forms

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM

GENERAL INFORMATION

Highway district:	District 4	Major street:	Massachusetts Avenue
MPO/RPA:	Boston MPO / MAPC	Minor street:	Marrett Road
City or Town:	Lexington, MA	Existing intersection control:	STOP
Prepared by:	J. Kavalaris	Number of legs at the	3
Submitted by:	BSC Group	ADT on major road:	19,700
Reviewed by:	S. Offei-Addo	ADT on minor road:	8,200
Phone:	617-896-4300	Total # of crashes (3-yr avg):	5
Email:	soffeiaddo@bscgroup.com	Speed limit (major road):	35 MPH
Date:	2/14/2013	Speed limit (minor road):	35 MPH

RESOURCES: DATA AND INFORMATION REQUIRED FOR ASSESSMENT

1. Traffic counts (ADT and turning movements)	6. Aerial photographs of location
2. Vehicle classification (trucks and buses)	7. Crash data (3 years)
3. Pedestrian and bicyclist counts	8. Crash diagrams
4. Plan sheet or layout of existing intersection	9. Speed data
5. Geometric layout of roundabout	

STEP 1: BRIEF DESCRIPTION OF EXISTING PROBLEMS

The intersection of Massachusetts Avenue (Mass Ave) and Marrett Road currently experiences long delays and large queues. Drivers turning left from Mass Ave onto Marrett Road have difficulty finding gaps in the southbound traffic on Mass Ave. Drivers exiting Marrett Road experience difficulties in finding gaps in traffic on Mass Ave in order to turn left or right. The project seeks to improve safety for pedestrians, bicyclists, and drivers; improve traffic operations; and reduce delays and congestion during the peak hours.

STEP 2: PROJECT OBJECTIVES (Check all that apply)

Question Number	Objectives	Primary		Secondary		Comment
		Yes	No	Yes	No	
2.1	Safety improvement	X				
2.2	Operational improvement	X				
2.3	Traffic-calming improvement		X		X	
2.4	Aesthetics/community enhancements			X		
2.5	Access management improvement		X		X	

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
STEP 3: TYPE OF ROUNDABOUT AND SPACE REQUIREMENTS (Check one)						
Question Number	**What type of roundabout is needed?**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
3.1	**Mini-roundabout**		X			
	Single-lane roundabout (Use Exhibit 2 or 3 for planning estimate of a single- lane roundabout.)	X			See the attachments for traffic volume data and roundabout type requirements.	Familiar to many motorists, pedestrians, and bicyclists. Has fewer conflict points than multi-lane roundabouts.
	Double-lane roundabout (Use Exhibit 2 or 3 for planning estimate of a double- lane roundabout.)		X			Multi-lane roundabout is a big step from a single-lane roundabout and could pose challenges for pedestrians, bicyclists, and motorists. Consequently, a multi-lane roundabout could lead to project delays and may be a major factor in rejecting a roundabout design from further consideration in some cities and towns.
3.2	**Space requirement** Would there be sufficient right-of-way to build the roundabout? (Use Exhibit 4 for planning estimate of space requirements.)		X		90 - 150 FT	Right-of-way and geometric complications can be overcome in certain situations. In addition, consider cost and impact of land acquisition.
Assessment (3.1 to 3.2)	Based on your answers above, is the space requirement met?		X			
STEP 4: ROUNDABOUT SCREENING FACTORS (Check all that apply)						
SAFETY FACTORS						
Question Number	**Does the intersection where a roundabout is being considered have safety issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.1	Resulting from multi-leg intersection or unusual geometry?		X			Too-tight skewed intersections can be problematic for large vehicles (design issues). In addition, too many legs could preclude using a roundabout design.
4.2	Resulting from high-speed crashes?		X			The purpose of considering a roundabout design could be to control speeds in conjunction with addressing other intersection control needs.
4.3	Causing crashes that are angle-type?	X			33% of crashes over a 3 year period were angle-type.	Roundabouts reduce the number of conflict points at which opposing vehicles intersect, hence they can provide possible solutions for angle crashes involving left-turn and crossing movements.
4.4	Associated with crashes resulting in personal injuries?	X			36% of crashes over a 3 year period resulted in personal injuries.	Collisions at roundabouts tend to be less severe because of low speeds on the entry approach and in the circulating roadway (20 - 25 mph).

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
Question Number	**Does the intersection where a roundabout is being considered have safety issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.5	Associated with sight distance obstructions caused by alignment on existing stop-controlled approach?		X			
4.6	Associated with a change-in-speed environment of the roadway?		X			Generally, they occur at the fringes of an urban environment.
4.7	Associated with visibility from all approaches?		X			Some types of topography and construction complications can be overcome. The Highway Division successfully addressed vertical alignment issues and steep grades of a roundabout proposal on Cape Cod.
4.8	Associated with pedestrian and bicyclist volumes?		X			This would be an issue with a multi-lane roundabout and would need for further investigation, but it is less of a concern with a single- lane roundabout.
Assessment (4-1 to 4-8)	Based on your answers above, is the project safety improvement objective met—i.e., would a roundabout design address one or more of the project safety issues?	X				
OPERATIONAL FACTORS						
Question Number	**Does the intersection where a roundabout is being considered have issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.9	Resulting from a high percentage of left turns experiencing high delay or a need for left-turn lanes or U-turns?	X				Roundabouts may accommodate left-turning vehicles more efficiently with lower delays because they may not require storage lanes or separate turning phases.
4.10	Resulting in high delay but failing to meet traffic signal warrants?		X			
4.11	Resulting from a high proportion of left turns experiencing high delay and limited storage on an off- ramp?		X			A roundabout design can be particularly beneficial at interchanges if the roundabout alternative does not require bridge widening.
Question Number	**Is the intersection where a roundabout is being considered located:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.12	Where traffic volumes on the minor roads are such that STOP or YIELD signs result in unacceptably high delays for the minor road?	X				
4.13	Where high traffic volumes during peak hours face excessive delays, but relatively low volumes and delays during non-peak hours?		X		Weekday traffic volumes appear relatively consistent from the morning peak hour through the middle of the day to the evening peak hour.	
4.14	Away from a signalized intersection, where queues in general will not spill back into the roundabout?			X	A traffic signal is being proposed at the nearby intersection of Mass Ave & Maple Street. If installed, queues from this signalized intersection may spill back into a roundabout.	Queue detection is an example of a possible remedy if queue spillback into the roundabout is occasional. Proper signal timing and coordination may remedy some queue spillbacks.

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
Question Number	**Is the intersection where a roundabout is being considered located:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.15	Away from a school drop-off/pickup area, or transit stop, where queues in general will not spill back into the roundabout?		X		Bus stops are located on both sides of Mass Ave in the vicinity of this intersection.	Bus bays or pullouts or locating transit stops further downstream of the splitter island may prevent queues from blocking the roundabout.
4.16	Outside of a coordinated arterial signal system or proposed roundabout where it will not impede progression through a corridor?	X				If the quality of progression is poor, a roundabout can replace a signalized intersection and improve coordination. Also, with correct signal timing and coordination, roundabouts and traffic signals can exist on the same corridor.
4.17	In an area where the percentage of major street traffic volume does not exceed 90% of the total entering traffic volume and the major street traffic volume is not opposed by relatively light traffic on the minor street?	X				Depends on how light the traffic is on the minor approach. In addition, if traffic calming is the main focus, then high or low traffic volume should not be the deciding factor.
4.18	Away from a railroad grade crossing, where queuing would not impact the roundabout or grade crossing?	X				Depends on the frequency of railroad trips.
4.19	Away from a direct emergency access roadway or driveway with preemption, where a roundabout would not impede emergency services?	X				Depends on the frequency of emergency trips.
Assessment (4.9 to 4.19)	Based on your answers above, is the project location favorable for roundabout installation—i.e., a roundabout design would function well and would not create additional operations problems?		X		A roundabout may create additional operation problems due to the potential installation of a nearby signal. It is expected that bus stops would be able to be adjusted.	
TRAFFIC CALMING FACTORS						
Question Number	**Does the intersection where a roundabout is being considered have issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.20	That need to be addressed by traffic-calming measures for pedestrians, bicyclists, motorists, and transit users?	X				Generally, roundabout designs addressing traffic calming are located on local and residential roads.
4.21	Resulting from changes in land-use environments or transition to a new land-use environment?		X			Roundabout designs addressing environment or land-use transitions are located in areas where there may be a need to signify to drivers that the character of the road and surrounding land use is changing and, therefore, they need to change their driving behavior.
Assessment (4.20 to 4.21)	Based on your answers above, is the project traffic-calming improvement objective met—i.e., would a roundabout design address one or more of the project traffic calming issues?			X	Traffic calming is not a main objective of this project. However it is expected that other elements of this project, such as lane narrowing, and bump-outs, will provide for traffic calming along the corridor.	

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
AESTHETICS AND COMMUNITY ENHANCEMENT FACTOR						
Question Number	**Is the proposed roundabout part of:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/supporting information**
4.22	A community enhancement or aesthetics (gateways) improvement project?			X	While aesthetics are important to the community and the project is in an historic area, it is not a primary objective of this project.	Roundabouts proposed for community enhancements and improved aesthetics should demonstrate that they would not introduce traffic problems that do not currently exist.
Assessment (4.22)	Based on your answer above, is the project aesthetics and community enhancement objective met—i.e., would the roundabout design address aesthetics and community enhancement issues?			X	While aesthetics are important to the community and the project is in an historic area, it is not a primary objective of this project.	
ACCESS MANAGEMENT FACTORS						
Question Number	**Does the corridor in which a roundabout is being considered have issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/supporting information**
4.23	Related to a controlled-access corridor, where U-turns/left turns are desirable at an intersection to access properties on the opposite side of the road?		X			Corridors that are hampered with numerous driveways, especially those to businesses, can benefit from roundabouts. Roundabouts in conjunction with raised medians facilitate the use of U-turns and left turns at intersections and allow right-in-right-out movements at driveways.
4.24	Related to many access/egress points where left turns experience unacceptable delay turning into and out of driveways and consolidating and controlling access points (installing a raised median) are desirable objectives?		X			
Assessment (4.23 to 4.24)	Based on your answers above, is the project access management objective met—i.e., does the roundabout address access management issues?			X	Access management is not an objective of this project.	

STEP 5: SCREENING EVALUATION (Please circle one decision)		
Decision	**Criteria**	**Comments**
Candidate	Advance a roundabout design for further analysis and design if it meets both of these criteria: 1. Space requirements 2. One or more of the project objectives	
Conditional	Advance a roundabout design for further analysis and design under these conditions (specify):	
Not recommended	A roundabout is not recommended for further consideration if it fails to meet either of these criteria: 1. Space requirements 2. None of the project objectives

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM

GENERAL INFORMATION

Highway district:	District 4	Major street:	Massachusetts Avenue
MPO/RPA:	Boston MPO / MAPC	Minor street:	Maple Street
City or Town:	Lexington, MA	Existing intersection control:	STOP
Prepared by:	J. Kavalaris	Number of legs at the intersection:	3
Submitted by:	BSC Group	ADT on major road:	20,200
Reviewed by:	S. Offei-Addo	ADT on minor road:	12,650
Phone:	617-896-4300	Total number of crashes (3-yr avg):	9.67
Email:	soffeiaddo@bscgroup.com	Speed limit (major road):	35 MPH
Date:	2/14/2013	Speed limit (minor road):	25 MPH

RESOURCES: DATA AND INFORMATION REQUIRED FOR ASSESSMENT

1. Traffic counts (ADT and turning movements)	6. Aerial photographs of location
2. Vehicle classification (trucks and buses)	7. Crash data (3 years)
3. Pedestrian and bicyclist counts	8. Crash diagrams
4. Plan sheet or layout of existing intersection	9. Speed data
5. Geometric layout of roundabout	

STEP 1: BRIEF DESCRIPTION OF EXISTING PROBLEMS

The intersection of Massachusetts Avenue (Mass Ave) and Maple Street experiences high traffic volumes and, in particular, high volumes of left turning vehicles from both Maple Street and Mass Ave southbound, particularly during the weekday morning and afternoon peak commuting hours. The geometry of the intersection consists of a traffic circle with large pavement areas that many vehicles have trouble navigating. The intersection experiences a high percentage of angle and rear-end crashes due to long queues, difficulty making turns, and driver impatience. Sidewalks near the intersection are in poor condition, and there are no pedestrian crosswalks at the intersection. The project seeks to improve safety for pedestrians, bicyclists, and drivers; improve traffic operations; and reduce delays and congestion during the peak hours.

STEP 2: PROJECT OBJECTIVES (Check all that apply)

Question Number	Objectives	Primary		Secondary		Comment
		Yes	No	Yes	No	
2.1	Safety improvement	X				
2.2	Operational improvement	X				
2.3	Traffic-calming improvement		X		X	
2.4	Aesthetics/community enhancements			X		
2.5	Access management improvement		X		X	

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
STEP 3: TYPE OF ROUNDABOUT AND SPACE REQUIREMENTS (Check one)						
Question Number	**What type of roundabout is needed?**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
3.1	**Mini-roundabout**		X			
	Single-lane roundabout (Use Exhibit 2 or 3 for planning estimate of a single- lane roundabout.)		X			Familiar to many motorists, pedestrians, and bicyclists. Has fewer conflict points than multi-lane roundabouts.
	Double-lane roundabout (Use Exhibit 2 or 3 for planning estimate of a double- lane roundabout.)	X			See the attachments for traffic volume data and roundabout type requirements.	Multi-lane roundabout is a big step from a single-lane roundabout and could pose challenges for pedestrians, bicyclists, and motorists. Consequently, a multi-lane roundabout could lead to project delays and may be a major factor in rejecting a roundabout design from further consideration in some cities and towns.
3.2	**Space requirement** Would there be sufficient right-of-way to build the roundabout? (Use Exhibit 4 for planning estimate of space requirements.)		X		120 - 200 FT	Right-of-way and geometric complications can be overcome in certain situations. In addition, consider cost and impact of land acquisition.
Assessment (3.1 to 3.2)	Based on your answers above, is the space requirement met?		X			
STEP 4: ROUNDABOUT SCREENING FACTORS (Check all that apply)						
SAFETY FACTORS						
Question Number	**Does the intersection where a roundabout is being considered have safety issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.1	Resulting from multi-leg intersection or unusual geometry?		X			Too-tight skewed intersections can be problematic for large vehicles (design issues). In addition, too many legs could preclude using a roundabout design.
4.2	Resulting from high-speed crashes?		X			The purpose of considering a roundabout design could be to control speeds in conjunction with addressing other intersection control needs.
4.3	Causing crashes that are angle-type?	X			41% of crashes over a 3 year period were angle-type.	Roundabouts reduce the number of conflict points at which opposing vehicles intersect, hence they can provide possible solutions for angle crashes involving left-turn and crossing movements.
4.4	Associated with crashes resulting in personal injuries?	X			27% of crashes over a 3 year period resulted in personal injuries.	Collisions at roundabouts tend to be less severe because of low speeds on the entry approach and in the circulating roadway (20 - 25 mph).

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
Question Number	**Does the intersection where a roundabout is being considered have safety issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.5	Associated with sight distance obstructions caused by alignment on existing stop-controlled approach?		X			
4.6	Associated with a change-in-speed environment of the roadway?		X			Generally, they occur at the fringes of an urban environment.
4.7	Associated with visibility from all approaches?		X			Some types of topography and construction complications can be overcome. The Highway Division successfully addressed vertical alignment issues and steep grades of a roundabout proposal on Cape Cod.
4.8	Associated with pedestrian and bicyclist volumes?		X			This would be an issue with a multi-lane roundabout and would need for further investigation, but it is less of a concern with a single- lane roundabout.
Assessment (4-1 to 4-8)	Based on your answers above, is the project safety improvement objective met—i.e., would a roundabout design address one or more of the project safety issues?		X			
OPERATIONAL FACTORS						
Question Number	**Does the intersection where a roundabout is being considered have issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.9	Resulting from a high percentage of left turns experiencing high delay or a need for left-turn lanes or U-turns?	X				Roundabouts may accommodate left-turning vehicles more efficiently with lower delays because they may not require storage lanes or separate turning phases.
4.10	Resulting in high delay but failing to meet traffic signal warrants?		X			
4.11	Resulting from a high proportion of left turns experiencing high delay and limited storage on an off- ramp?		X			A roundabout design can be particularly beneficial at interchanges ifthe roundabout alternative does not require bridge widening.
Question Number	**Is the intersection where a roundabout is being considered located:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.12	Where traffic volumes on the minor roads are such that STOP or YIELD signs result in unacceptably high delays for the minor	X				
4.13	Where high traffic volumes during peak hours face excessive delays, but relatively low volumes and delays during non-peak hours?		X		Weekday traffic volumes appear relatively consistent from the morning peak hour through the middle of the day to the evening peak hour.	
4.14	Away from a signalized intersection, where queues in general will not spill back into the roundabout?	X			A traffic signal is being proposed at the nearby intersection of Mass Ave & Marrett Road. If installed, queues from this signalized intersection may spill back into a roundabout.	Queue detection is an example of a possible remedy if queue spillback into the roundabout is occasional. Proper signal timing and coordination may remedy some queue spillbacks.

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
Question Number	**Is the intersection where a roundabout is being considered located:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.15	Away from a school drop-off/pickup area, or transit stop, where queues in general will not spill back into the roundabout?		X		Bus stops are located on both sides of Mass Ave in the vicinity of this intersection.	Bus bays or pullouts or locating transit stops further downstream of the splitter island may prevent queues from blocking the roundabout.
4.16	Outside of a coordinated arterial signal system or proposed roundabout where it will not impede progression through a corridor?	X				If the quality of progression is poor, a roundabout can replace a signalized intersection and improve coordination. Also, with correct signal timing and coordination, roundabouts and traffic signals can exist on the same corridor.
4.17	In an area where the percentage of major street traffic volume does not exceed 90% of the total entering traffic volume and the major street traffic volume is not opposed by relatively light traffic on the minor street?	X				Depends on how light the traffic is on the minor approach. In addition, if traffic calming is the main focus, then high or low traffic volume should not be the deciding factor.
4.18	Away from a railroad grade crossing, where queuing would not impact the roundabout or grade crossing?	X				Depends on the frequency of railroad trips.
4.19	Away from a direct emergency access roadway or driveway with preemption, where a roundabout would not impede emergency services?		X		An emergency signal for the fire station is located 500 feet from the intersection.	Depends on the frequency of emergency trips.
Assessment (4.9 to 4.19)	Based on your answers above, is the project location favorable for roundabout installation—i.e., a roundabout design would function well and would not create additional operations problems?		X		A roundabout may create additional operation problems due to the potential installation of a nearby signal. It is expected that bus stops would be able to be adjusted.	
TRAFFIC CALMING FACTORS						
Question Number	**Does the intersection where a roundabout is being considered have issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.20	That need to be addressed by traffic-calming measures for pedestrians, bicyclists, motorists, and transit users?			X	Pedestrian and bicycle safety issues are of concern at this location. It is expected that these issues can be resolved with methods other than traffic calming.	Generally, roundabout designs addressing traffic calming are located on local and residential roads.
4.21	Resulting from changes in land-use environments or transition to a new land-use environment?		X			Roundabout designs addressing environment or land-use transitions are located in areas where there may be a need to signify to drivers that the character of the road and surrounding land use is changing and, therefore, they need to change their driving behavior.
Assessment (4.20 to 4.21)	Based on your answers above, is the project traffic-calming improvement objective met—i.e., would a roundabout design address one or more of the project traffic calming issues?			X	Traffic calming is not a main objective of this project. However it is expected that other elements of this project, such as lane narrowing, and bump-outs, will provide for traffic calming along the corridor.	

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
AESTHETICS AND COMMUNITY ENHANCEMENT FACTOR						
Question Number	**Is the proposed roundabout part of:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/supporting information**
4.22	A community enhancement or aesthetics (gateways) improvement project?			X	While aesthetics are important to the community and the project is in an historic area, it is not a primary objective of this project.	Roundabouts proposed for community enhancements and improved aesthetics should demonstrate that they would not introduce traffic problems that do not currently exist.
Assessment (4.22)	Based on your answer above, is the project aesthetics and community enhancement objective met—i.e., would the roundabout design address aesthetics and community enhancement issues?			X	While aesthetics are important to the community and the project is in an historic area, it is not a primary objective of this project.	
ACCESS MANAGEMENT FACTORS						
Question Number	**Does the corridor in which a roundabout is being considered have issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/supporting information**
4.23	Related to a controlled-access corridor, where U-turns/left turns are desirable at an intersection to access properties on the opposite side of the road?		X			Corridors that are hampered with numerous driveways, especially those to businesses, can benefit from roundabouts. Roundabouts in conjunction with raised medians facilitate the use of U-turns and left turns at intersections and allow right-in-right-out movements at driveways.
4.24	Related to many access/egress points where left turns experience unacceptable delay turning into and out of driveways and consolidating and controlling access points (installing a raised median) are desirable objectives?		X			
Assessment (4.23 to 4.24)	Based on your answers above, is the project access management objective met—i.e., does the roundabout address access management issues?			X	Access management is not an objective of this project.	

STEP 5: SCREENING EVALUATION (Please circle one decision)		
Decision	**Criteria**	**Comments**
Candidate	Advance a roundabout design for further analysis and design if it meets both of these criteria: 1. Space requirements 2. One or more of the project objectives	
Conditional	Advance a roundabout design for further analysis and design under these conditions (specify):	
Not recommended	A roundabout is not recommended for further consideration if it fails to meet either of these criteria: 1. Space requirements 2. None of the project objectives

Date:	2/14/2013	Speed limit (minor road):	30 MPH

RESOURCES: DATA AND INFORMATION REQUIRED FOR ASSESSMENT

1. Traffic counts (ADT and turning movements)	6. Aerial photographs of location
2. Vehicle classification (trucks and buses)	7. Crash data (3 years)
3. Pedestrian and bicyclist counts	8. Crash diagrams
4. Plan sheet or layout of existing intersection	9. Speed data
5. Geometric layout of roundabout	

STEP 1: BRIEF DESCRIPTION OF EXISTING PROBLEMS

The intersection of Massachusetts Avenue (Mass Ave) and Pleasant Street currently experiences high levels of congestion and long delays. Vehicles wishing to turn left from Pleasant Street onto Mass Ave northbound have difficulty finding gaps in the traffic in order to turn. This results in long delays and queues on Pleasant Street. In addition, the current geometry of this area consists of a mini-roundabout with large paved areas, which many drivers have difficulty navigating. The intersection has poor or no sidewalks and long crosswalks. The project seeks to improve safety for pedestrians, bicyclists, and drivers; improve traffic operations; and reduce delays and congestion during the peak hours.

STEP 2: PROJECT OBJECTIVES (Check all that apply)

Question Number	Objectives	Primary		Secondary		Comment
		Yes	No	Yes	No	
2.1	Safety improvement	X				
2.2	Operational improvement	X				
2.3	Traffic-calming improvement		X		X	
2.4	Aesthetics/community enhancements			X		
2.5	Access management improvement		X		X	

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
STEP 3: TYPE OF ROUNDABOUT AND SPACE REQUIREMENTS (Check one)						
Question Number	**What type of roundabout is needed?**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
3.1	**Mini-roundabout**		X			
	Single-lane roundabout (Use Exhibit 2 or 3 for planning estimate of a single- lane roundabout.)	X			See the attachments for traffic volume data and roundabout type requirements. A double lane approach is recommended for Mass Ave southbound.	Familiar to many motorists, pedestrians, and bicyclists. Has fewer conflict points than multi-lane roundabouts.
	Double-lane roundabout (Use Exhibit 2 or 3 for planning estimate of a double- lane roundabout.)		X			Multi-lane roundabout is a big step from a single-lane roundabout and could pose challenges for pedestrians, bicyclists, and motorists. Consequently, a multi-lane roundabout could lead to project delays and may be a major factor in rejecting a roundabout design from further consideration in some cities and towns.
3.2	**Space requirement** Would there be sufficient right-of-way to build the roundabout? (Use Exhibit 4 for planning estimate of space requirements.)	X			90 - 150 FT	Right-of-way and geometric complications can be overcome in certain situations. In addition, consider cost and impact of land acquisition.
Assessment (3.1 to 3.2)	Based on your answers above, is the space requirement met?	X				
STEP 4: ROUNDABOUT SCREENING FACTORS (Check all that apply)						
SAFETY FACTORS						
Question Number	**Does the intersection where a roundabout is being considered have safety issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.1	Resulting from multi-leg intersection or unusual geometry?	X			The intersection includes wide pavement areas and a circle in the center of the pavement. Follen Road intersects to create unusual geometry.	Too-tight skewed intersections can be problematic for large vehicles (design issues). In addition, too many legs could preclude using a roundabout design.
4.2	Resulting from high-speed crashes?		X			The purpose of considering a roundabout design could be to control speeds in conjunction with addressing other intersection control needs.
4.3	Causing crashes that are angle-type?	X			43% of crashes over a 3 year period were angle-type.	Roundabouts reduce the number of conflict points at which opposing vehicles intersect, hence they can provide possible solutions for angle crashes involving left-turn and crossing movements.
4.4	Associated with crashes resulting in personal injuries?	X			29% of crashes over a 3 year period resulted in personal injuries.	Collisions at roundabouts tend to be less severe because of low speeds on the entry approach and in the circulating roadway (20 - 25 mph).

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
Question Number	**Does the intersection where a roundabout is being considered have safety issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.5	Associated with sight distance obstructions caused by alignment on existing stop-controlled approach?		X			
4.6	Associated with a change-in-speed environment of the roadway?		X			Generally, they occur at the fringes of an urban environment.
4.7	Associated with visibility from all approaches?		X			Some types of topography and construction complications can be overcome. The Highway Division successfully addressed vertical alignment issues and steep grades of a roundabout proposal on Cape Cod.
4.8	Associated with pedestrian and bicyclist volumes?		X			This would be an issue with a multi-lane roundabout and would need for further investigation, but it is less of a concern with a single- lane roundabout.
Assessment (4-1 to 4-8)	Based on your answers above, is the project safety improvement objective met—i.e., would a roundabout design address one or more of the project safety issues?	X				
OPERATIONAL FACTORS

4.9	Resulting from a high percentage of left turns experiencing high delay or a need for left-turn lanes or U-turns?	X				Roundabouts may accommodate left-turning vehicles more efficiently with lower delays because they may not require storage lanes or separate turning phases.
4.10	Resulting in high delay but failing to meet traffic signal warrants?		X			
4.11	Resulting from a high proportion of left turns experiencing high delay and limited storage on an off- ramp?		X			A roundabout design can be particularly beneficial at interchanges if the roundabout alternative does not require bridge widening.
Question Number	**Is the intersection where a roundabout is being considered located:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.12	Where traffic volumes on the minor roads are such that STOP or YIELD signs result in unacceptably high delays for the minor road?	X				
4.13	Where high traffic volumes during peak hours face excessive delays, but relatively low volumes and delays during non-peak hours?		X		Weekday traffic volumes appear relatively consistent from the morning peak hour through the middle of the day to the evening peak hour.	
4.14	Away from a signalized intersection, where queues in general will not spill back into the roundabout?		X		A pedestrian traffic signal is located approximately 1000 feet from the intersection.	Queue detection is an example of a possible remedy if queue spillback into the roundabout is occasional. Proper signal timing and coordination may remedy some queue spillbacks.

MASSACHUSETTS ROUNDABOUT INSTALLATION SCREENING FORM						
Question Number	**Is the intersection where a roundabout is being considered located:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.15	Away from a school drop-off/pickup area, or transit stop, where queues in general will not spill back into the roundabout?		X		Bus stops are located on both sides of Mass Ave in the vicinity of this intersection. A school drop-off is located on Mass Ave north of this intersection.	Bus bays or pullouts or locating transit stops further downstream of the splitter island may prevent queues from blocking the roundabout.
4.16	Outside of a coordinated arterial signal system or proposed roundabout where it will not impede progression through a corridor?	X				If the quality of progression is poor, a roundabout can replace a signalized intersection and improve coordination. Also, with correct signal timing and coordination, roundabouts and traffic signals can exist on the same corridor.
4.17	In an area where the percentage of major street traffic volume does not exceed 90% of the total entering traffic volume and the major street traffic volume is not opposed by relatively light traffic on the minor street?	X				Depends on how light the traffic is on the minor approach. In addition, if traffic calming is the main focus, then high or low traffic volume should not be the deciding factor.
4.18	Away from a railroad grade crossing, where queuing would not impact the roundabout or grade crossing?	X				Depends on the frequency of railroad trips.
4.19	Away from a direct emergency access roadway or driveway with preemption, where a roundabout would not impede emergency services?	X				Depends on the frequency of emergency trips.
Assessment (4.9 to 4.19)	Based on your answers above, is the project location favorable for roundabout installation—i.e., a roundabout design would function well and would not create additional operations problems?	X				
TRAFFIC CALMING FACTORS						
Question Number	**Does the intersection where a roundabout is being considered have issues:**	**Yes**	**No**	**Other**	**Comment**	**Considerations/Supporting Information**
4.20	That need to be addressed by traffic-calming measures for pedestrians, bicyclists, motorists, and transit users?	X				Generally, roundabout designs addressing traffic calming are located on local and residential roads.
4.21	Resulting from changes in land-use environments or transition to a new land-use environment?		X			Roundabout designs addressing environment or land-use transitions are located in areas where there may be a need to signify to drivers that the character of the road and surrounding land use is changing and, therefore, they need to change their driving behavior.
Assessment (4.20 to 4.21)	Based on your answers above, is the project traffic-calming improvement objective met—i.e., would a roundabout design address one or more of the project traffic calming issues?			X	Traffic calming is not a main objective of this project. However it is expected that other elements of this project, such as lane narrowing, and bump-outs, will provide for traffic calming along the corridor.

Rule of Thumb: If the sum of the entering and circulating volumes for each approach is less than 1,000 veh/h, then a single-lane roundabout is likely to operate acceptably.

Volume Thresholds for Determining the Number of Entry Lanes Required

Volume Range (sum of entering and conflicting volumes)	**Number of Lanes Required**
0 to 1,000 veh/h	Single-lane entry likely to be sufficient
1,000 to 1,300 veh/h	Two-lane entry may be needed Single-lane may be sufficient based upon more detailed analysis.
1,300 to 1,800 veh/h	Two-lane entry likely to be sufficient
Above 1,800 veh/h	More than two entering lanes may be required A more detailed capacity evaluation should be conducted to verify lane numbers and arrangements.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
